We have a habit in writing articles published in scientific journals to make the work as finished as possible, to cover up all the tracks, to not worry about the blind alleys or describe how you had the wrong idea first, and so on. So there isn’t any place to publish, in a dignified manner, what you actually did in order to get to do the work.

—Richard P. Feynman
Nobel Lecture, 1966

Philip Russell led a team of researchers at the University Bath in the 1990s where photonic crystal fibers were drawn. Thin hollow capillary tubes were stacked together and then fused to make a preform as shown on the left. A photonic crystal fiber was then drawn at a high temperature from this preform. Photonic crystal fibers have the ability to guide light endlessly in a single mode, and have highly desirable nonlinear properties for various photonics applications in the manipulation of light, such as the generation of supercontinuum light. (Courtesy of Professor Philip Russell.)
To Nicolette, who brightens my every day
and makes me smile with joy every time I see her.
PREFACE

The first edition of this book was written more than 12 years ago. At the time it was meant as an easy-to-read book for third-year engineering or applied physics undergraduate students; it emphasized qualitative explanations and relied heavily on intuitive derivations. As things turned out, the first edition ended up being used in fourth-year elective classes, and even in graduate courses on optoelectronics. Many of the instructors teaching at that level rightly needed better derivations, more rigor, better explanations, and, of course, many more topics and problems. We have all at one time or another suffered from how wrong some intuitive short-cut derivations can be. The second edition was therefore prepared by essentially rewriting the text almost from scratch with much better rigor and explanations, but without necessarily dwelling on mathematical details. Many new exciting practical examples have been introduced, and numerous new problems have been added. The book also had to be totally modernized given that much had happened in the intervening 12 years that deserved being covered in an undergraduate course.

FEATURES, CHANGES, AND REVISIONS IN THE SECOND EDITION

The second edition represents a total revision of the first edition, with numerous additional features and enhancements.

• All chapters have been totally revised and extended.
• Numerous modern topics in photonics have been added to all the chapters.
• There are Additional Topics that can be covered in more advanced courses, or in courses that run over two semesters.
• There are many more new examples and solved problems within chapters, and many more practical end-of-chapter problems that start from basic concepts and build up onto advanced applications.
• Nearly all the illustrations and artwork in the first edition have been revised and redrawn to better reflect the concepts.
• Numerous new illustrations have been added to convey the concepts as clearly as possible.
• Photographs have been added, where appropriate, to enhance the readability of the book and to illustrate typical modern photonic/optoelectronic devices.
• The previous edition’s Chapter 7 on photovoltaics has been incorporated into this edition’s Chapter 5 as an Additional Topic, thus allowing more photonics-related topics to be covered.
• Advanced or complicated mathematical derivations are avoided and, instead, the emphasis is placed on concepts and engineering applications.
• Useful and essential equations in photonics are given with explanations and are used in examples and problems to give the student a sense of what typical values are.
• Cross referencing in the second edition has been avoided as much as possible, without too much repetition, to allow various sections and chapters to be skipped as desired by the reader.
• There is greater emphasis on practical or engineering examples; care has been taken to consider various photonics/optoelectronics courses at the undergraduate level across major universities.
Preface

• The second edition is supported by an extensive PowerPoint presentation for instructors who have adopted the book for their course. The PowerPoint slides have all the illustrations in color, and include additional color photos. The basic concepts and equations are also highlighted in additional slides. There are also numerous slides with examples and solved problems. Instructors should contact the publisher to access the PowerPoint.

• The second edition is also supported by an extensive Solutions Manual for instructors only. This is available from the publisher.

The second edition continues to represent a first course in optoelectronic materials and devices suitable for a half- or one-semester course at the undergraduate level either at the third- or fourth-year level in electrical engineering, engineering physics, and materials science and engineering departments. With its additional topics, it can also be used as an introductory textbook at the graduate level. Normally the students would not have covered Maxwell’s equations. Although Maxwell’s equations are mentioned in the text to alert the student, they are not used in developing the principles. It is assumed that the students would have taken a basic first- or second-year physics course, with modern physics, and would have seen rudimentary concepts in geometrical optics, interference, and diffraction, but not Fresnel’s equations and concepts such as group velocity and group index. Typically an optoelectronics course would be given either after a semiconductor devices course or concurrently with it. Students would have been exposed to elementary quantum mechanics concepts, perhaps in conjunction with a basic semiconductor science course.

Most topics are initially introduced through qualitative explanations to allow the concept to be grasped first before any mathematical development. The mathematical level is assumed to include vectors, complex numbers, and partial differentiation but excludes reliance on Fourier transforms. On the one hand, we are required to cover as much as possible and, on the other hand, professional engineering accreditation requires students to solve numerical problems and carry out “design calculations.” In preparing the text, I tried to satisfy engineering degree accreditation requirements in as much breadth as possible. Obviously one cannot solve numerical problems, carry out design calculations, and at the same time derive each equation without expanding the size of the text to an intolerable level. I have missed many topics but I have also covered many, though, undoubtedly, it is my own very biased selection.

I would like to thank two very special colleagues, whom I have known for a very long time, for their comments and help: Harry Ruda (University of Toronto) and Raman Kashyap (École Polytechnique de Montréal)—two perfect gentlemen who read some of the manuscript and made valuable criticisms toward this final version.

No textbook is perfect and I can only improve the text with your input. Please feel free to write to me with your comments. Although I may not be able to reply to each individual comment and suggestion, I do read all my email messages and take good note of suggestions and comments. Many instructors did, in fact, write to me on the first edition, pointed out how things could have been done better, and various mistakes one never seems to be able to eliminate totally. I hope that the second edition will at least go far in satisfying some of their criticisms. There is an important old adage that goes something like this (somewhat paraphrased), “a good diagram is worth a thousand words, but a bad diagram takes a thousand words to explain.” I used a software package called Canvas to draw nearly all the line-art in the second edition as clearly as possible, and errors are all mea culpa; feel free to email me the errors you notice in the figures. All third-party artwork and photographs have been used with permission; and I’m grateful to
Pearson Education for meticulously obtaining permission from copyright holders. If you like the second edition, and cannot wait for the third, you can always write your comments and recommendations directly to the Sponsoring Editor for Electrical Engineering, Pearson Higher Education, One Lake Street, Upper Saddle River, NJ 07458, USA. This is the best way to have your input heard.

Resources for Instructors

• Instructor’s Solutions Manual. An instructor’s solutions manual was prepared by the author.
• Presentation Resources. All art from the text is available in PowerPoint slide and JPEG format.

These files are available for download from the instructor Resource Center at www.pearsonhighered.com/Kasap. If you are in need of a login and password for this site, please contact your local Pearson Prentice-Hall representative.

Saskatoon (March 2012)

Gordon Gould (1920–2005) obtained his BSc in Physics (1941) from Union College in Schenectady and MSc from Yale University. Gould came up with the idea of an optically pumped laser during his PhD work at Columbia University around 1957—he is now recognized for the invention of optical pumping as a means of exciting masers and lasers. He has been also credited for collisional pumping as in gas lasers, and a variety of application-related laser patents. After nearly three decades of legal disputes, in 1987, he eventually won rights to the invention of the laser. Gould’s laboratory logbook even had an entry with the heading “Some rough calculations on the feasibility of a LASER: Light Amplification by Stimulated Emission of Radiation,” which is the first time that this acronym appears. Union College awarded Gould an honorary Doctor of Sciences in 1978 and the Eliphalet Nott Medal in 1995. (Courtesy of Union College Alumni Office.)
Fiber-coupled phase and amplitude modulators. The Pockels effect in lithium niobate is used to modulate the refractive index and hence the phase of an optical signal. In amplitude modulators, the Pockels effect is used to modulate the refractive indices of the two arms of a Mach–Zehnder interferometer, and hence the optical output. (© JENOPTIK Optical System GmbH.)

Fiber-coupled optical isolators: fiber isolators. The signal is allowed to propagate in one direction only, along the arrow shown on the device. The principle is based on Faraday rotation. (Courtesy of Thorlabs.)
CONTENTS

Chapter 1  Wave Nature of Light  3
  1.1 Light Waves in a Homogeneous Medium  3
    A. Plane Electromagnetic Wave  3
    B. Maxwell’s Wave Equation and Diverging Waves  6
      Example 1.1.1 A diverging laser beam  10
  1.2 Refractive Index and Dispersion  10
      Example 1.2.1 Sellmeier equation and diamond  13
      Example 1.2.2 Cauchy equation and diamond  14
  1.3 Group Velocity and Group Index  14
      Example 1.3.1 Group velocity  17
      Example 1.3.2 Group velocity and index  17
      Example 1.3.3 Group and phase velocities  18
  1.4 Magnetic Field, Irradiance, and Poynting Vector  18
      Example 1.4.1 Electric and magnetic fields in light  21
      Example 1.4.2 Power and irradiance of a Gaussian beam  21
  1.5 Snell’s Law and Total Internal Reflection (TIR)  22
      Example 1.5.1 Beam displacement  25
  1.6 Fresnel’s Equations  26
      A. Amplitude Reflection and Transmission Coefficients (r and t)  26
      B. Intensity, Reflectance, and Transmittance  32
      C. Goos-Hänchen Shift and Optical Tunneling  33
        Example 1.6.1 Reflection of light from a less dense medium (internal
        reflection)  35
        Example 1.6.2 Reflection at normal incidence, and internal and external
        reflection  36
        Example 1.6.3 Reflection and transmission at the Brewster angle  37
  1.7 Antireflection Coatings and Dielectric Mirrors  38
      A. Antireflection Coatings on Photodetectors and Solar Cells  38
        Example 1.7.1 Antireflection coating on a photodetector  39
      B. Dielectric Mirrors and Bragg Reflectors  40
        Example 1.7.2 Dielectric mirror  42
  1.8 Absorption of Light and Complex Refractive Index  43
      Example 1.8.1 Complex refractive index of InP  46
      Example 1.8.2 Reflectance of CdTe around resonance absorption  47
  1.9 Temporal and Spatial Coherence  47
      Example 1.9.1 Coherence length of LED light  50
  1.10 Superposition and Interference of Waves  51

Contents

1.11 Multiple Interference and Optical Resonators 53
   Example 1.11.1 Resonator modes and spectral width of a semiconductor Fabry–Perot cavity 57

1.12 Diffraction Principles 58
   A. Fraunhofer Diffraction 58
      Example 1.12.1 Resolving power of imaging systems 63
   B. Diffraction Grating 64
      Example 1.12.2 A reflection grating 67

Additional Topics 68
1.13 Interferometers 68
1.14 Thin Film Optics: Multiple Reflections in Thin Films 70
   Example 1.14.1 Thin film optics 72
1.15 Multiple Reflections in Plates and Incoherent Waves 73
1.16 Scattering of Light 74
1.17 Photonic Crystals 76

Chapter 2 Dielectric Waveguides and Optical Fibers 95
2.1 Symmetric Planar Dielectric Slab Waveguide 95
   A. Waveguide Condition 95
   B. Single and Multimode Waveguides 100
   C. TE and TM Modes 100
      Example 2.1.1 Waveguide modes 101
      Example 2.1.2 V-number and the number of modes 102
      Example 2.1.3 Mode field width, 2w0 103
2.2 Modal and Waveguide Dispersion in Planar Waveguides 104
   A. Waveguide Dispersion Diagram and Group Velocity 104
   B. Intermodal Dispersion 105
   C. Intramodal Dispersion 106
2.3 Step-Index Optical Fiber 107
   A. Principles and Allowed Modes 107
      Example 2.3.1 A multimode fiber 112
      Example 2.3.2 A single-mode fiber 112
   B. Mode Field Diameter 112
      Example 2.3.3 Mode field diameter 113
   C. Propagation Constant and Group Velocity 114
      Example 2.3.4 Group velocity and delay 115
   D. Modal Dispersion in Multimode Step-Index Fibers 116
      Example 2.3.5 A multimode fiber and dispersion 116

2.4 Numerical Aperture 117
   Example 2.4.1 A multimode fiber and total acceptance angle 118
   Example 2.4.2 A single-mode fiber 118

2.5 Dispersion In Single-Mode Fibers 119
   A. Material Dispersion 119
   B. Waveguide Dispersion 120
   C. Chromatic Dispersion 122
   D. Profile and Polarization Dispersion Effects 122
      Example 2.5.1 Material dispersion 124
      Example 2.5.2 Material, waveguide, and chromatic dispersion 125
      Example 2.5.3 Chromatic dispersion at different wavelengths 125
      Example 2.5.4 Waveguide dispersion 126

2.6 Dispersion Modified Fibers and Compensation 126
   A. Dispersion Modified Fibers 126
   B. Dispersion Compensation 128
      Example 2.6.1 Dispersion compensation 130

2.7 Bit Rate, Dispersion, and Electrical and Optical Bandwidth 130
   A. Bit Rate and Dispersion 130
   B. Optical and Electrical Bandwidth 133
      Example 2.7.1 Bit rate and dispersion for a single-mode fiber 135

2.8 The Graded Index (GRIN) Optical Fiber 135
   A. Basic Properties of GRIN Fibers 135
   B. Telecommunications 139
      Example 2.8.1 Dispersion in a graded index fiber and bit rate 140
      Example 2.8.2 Dispersion in a graded index fiber and bit rate 141

2.9 Attenuation in Optical Fibers 142
   A. Attenuation Coefficient and Optical Power Levels 142
      Example 2.9.1 Attenuation along an optical fiber 144
   B. Intrinsic Attenuation in Optical Fibers 144
   C. Intrinsic Attenuation Equations 146
      Example 2.9.2 Rayleigh scattering equations 147
   D. Bending losses 148
      Example 2.9.3 Bending loss for SMF 151

2.10 Fiber Manufacture 152
   A. Fiber Drawing 152
   B. Outside Vapor Deposition 153
      Example 2.10.1 Fiber drawing 155

Additional Topics 155

2.11 Wavelength Division Multiplexing: WDM 155
2.12 Nonlinear Effects in Optical Fibers and DWDM 157

Chapter 3  Semiconductor Science and Light-Emitting Diodes  179

3.1 Review of Semiconductor Concepts and Energy Bands  179
   A. Energy Band Diagrams, Density of States, Fermi-Dirac Function and Metals  179
   B. Energy Band Diagrams of Semiconductors  182

3.2 Semiconductor Statistics  184

3.3 Extrinsic Semiconductors  187
   A.  \textit{n}-Type and \textit{p}-Type Semiconductors  187
   B. Compensation Doping  190
   C. Nondegenerate and Degenerate Semiconductors  191
   E. Energy Band Diagrams in an Applied Field  192
      \textbf{Example 3.3.1} Fermi levels in semiconductors  193
      \textbf{Example 3.3.2} Conductivity of \textit{n}-Si  193

3.4 Direct and Indirect Bandgap Semiconductors: \textit{E-k} Diagrams  194

3.5 \textit{pn} Junction Principles  198
   A. Open Circuit  198
   B. Forward Bias and the Shockley Diode Equation  201
   C. Minority Carrier Charge Stored in Forward Bias  206
   D. Recombination Current and the Total Current  206

3.6 \textit{pn} Junction Reverse Current  209

3.7 \textit{pn} Junction Dynamic Resistance and Capacitances  211
   A. Depletion Layer Capacitance  211
   B. Dynamic Resistance and Diffusion Capacitance for Small Signals  213

3.8 Recombination Lifetime  214
   A. Direct Recombination  214
   B. Indirect Recombination  216
      \textbf{Example 3.8.1} A direct bandgap \textit{pn} junction  216

3.9 \textit{pn} Junction Band Diagram  218
   A. Open Circuit  218
   B. Forward and Reverse Bias  220
      \textbf{Example 3.9.1} The built-in voltage from the band diagram  221

3.10 Heterojunctions  222
3.11 Light-Emitting Diodes: Principles 224
   A. Homojunction LEDs 224
   B. Heterostructure High Intensity LEDs 226
   C. Output Spectrum 228
      Example 3.11.1 LED spectral linewidth 231
      Example 3.11.2 LED spectral width 232
      Example 3.11.3 Dependence of the emission peak and linewidth on temperature 233

3.12 Quantum Well High Intensity LEDs 233
   Example 3.12.1 Energy levels in the quantum well 236

3.13 LED Materials and Structures 237
   A. LED Materials 237
   B. LED Structures 238
      Example 3.13.1 Light extraction from a bare LED chip 241

3.14 LED Efficiencies and Luminous Flux 242
   Example 3.14.1 LED efficiencies 244
   Example 3.14.2 LED brightness 245

3.15 Basic LED Characteristics 245

3.16 LEDs for Optical Fiber Communications 246

3.17 Phosphors and White LEDs 249

Additional Topics 251

3.18 LED Electronics 251
   Questions and Problems 254

Chapter 4 Stimulated Emission Devices: Optical Amplifiers and Lasers 265

4.1 Stimulated Emission, Photon Amplification, and Lasers 265
   A. Stimulated Emission and Population Inversion 265
   B. Photon Amplification and Laser Principles 266
   C. Four-Level Laser System 269

4.2 Stimulated Emission Rate and Emission Cross-Section 270
   A. Stimulated Emission and Einstein Coefficients 270
      Example 4.2.1 Minimum pumping power for three-level laser systems 272
   B. Emission and Absorption Cross-Sections 273
      Example 4.2.2 Gain coefficient in a Nd³⁺-doped glass fiber 275

4.3 Erbium-Doped Fiber Amplifiers 276
   A. Principle of Operation and Amplifier Configurations 276
   B. EDFA Characteristics, Efficiency, and Gain Saturation 280
      Example 4.3.1 An erbium-doped fiber amplifier 283
   C. Gain-Flattened EDFAs and Noise Figure 284

4.4 Gas Lasers: The He-Ne Laser 287
   Example 4.4.1 Efficiency of the He-Ne laser 290
4.5 The Output Spectrum of a Gas Laser 290
   Example 4.5.1 Doppler broadened linewidth 293
4.6 Laser Oscillations: Threshold Gain Coefficient and Gain Bandwidth 295
   A. Optical Gain Coefficient $g$ 295
   B. Threshold Gain Coefficient $g_{th}$ and Output Power 296
      Example 4.6.1 Threshold population inversion for the He-Ne laser 299
   C. Output Power and Photon Lifetime in the Cavity 299
      Example 4.6.2 Output power and photon cavity lifetime $\tau_{ph}$ 301
   D. Optical Cavity, Phase Condition, Laser Modes 301
4.7 Broadening of the Optical Gain Curve and Linewidth 303
4.8 Pulsed Lasers: $Q$-Switching and Mode Locking 307
   A. $Q$-Switching 307
   B. Mode Locking 310
4.9 Principle of the Laser Diode 311
4.10 Heterostructure Laser Diodes 315
   Example 4.10.1 Modes in a semiconductor laser and the optical cavity length 320
4.11 Quantum Well Devices 321
   Example 4.11.1 A GaAs quantum well 323
4.12 Elementary Laser Diode Characteristics 324
   Example 4.12.1 Laser output wavelength variation with temperature 330
   Example 4.12.2 Laser diode efficiencies for a sky-blue LD 330
   Example 4.12.3 Laser diode efficiencies 331
4.13 Steady State Semiconductor Rate Equations: The Laser Diode Equation 332
   A. Laser Diode Equation 332
   B. Optical Gain Curve, Threshold, and Transparency Conditions 335
      Example 4.13.1 Threshold current and optical output power from a Fabry–Perot heterostructure laser diode 336
4.14 Single Frequency Semiconductor Lasers 338
   A. Distributed Bragg Reflector LDs 338
   B. Distributed Feedback LDs 339
   C. External Cavity LDs 342
      Example 4.14.1 DFB LD wavelength 344
4.15 Vertical Cavity Surface Emitting Lasers 344
4.16 Semiconductor Optical Amplifiers 348
Additional Topics 350
4.17 Superluminescent and Resonant Cavity LEDs: SLD and RCLED 350
4.18 Direct Modulation of Laser Diodes 351
4.19 Holography 354

Questions and Problems 357

Chapter 5 Photodetectors and Image Sensors 365
5.1 Principle of the pn Junction Photodiode 365
   A. Basic Principles 365
   B. Energy Band Diagrams and Photodetection Modes 367
   C. Current-Voltage Convention and Modes of Operation 369
5.2 Shockley-Ramo Theorem and External Photocurrent 370
5.3 Absorption Coefficient and Photodetector Materials 372
5.4 Quantum Efficiency and Responsivity 375
   Example 5.4.1 Quantum efficiency and responsivity 378
   Example 5.4.2 Maximum quantum efficiency 379
5.5 The pin Photodiode 379
   Example 5.5.1 Operation and speed of a pin photodiode 383
   Example 5.5.2 Photocarrier Diffusion in a pin photodiode 383
   Example 5.5.3 Responsivity of a pin photodiode 384
   Example 5.5.4 Steady state photocurrent in the pin photodiode 385
5.6 Avalanche Photodiode 386
   A. Principles and Device Structures 386
      Example 5.6.1 InGaAs APD responsivity 390
      Example 5.6.2 Silicon APD 390
   B. Impact Ionization and Avalanche Multiplication 390
      Example 5.6.3 Avalanche multiplication in Si APDs 392
5.7 Heterojunction Photodiodes 393
   A. Separate Absorption and Multiplication APD 393
   B. Superlattice APDs 395
5.8 Schottky Junction Photodetector 397
5.9 Phototransistors 401
5.10 Photoconductive Detectors and Photoconductive Gain 402
5.11 Basic Photodiode Circuits 405
5.12 Noise in Photodetectors 408
   A. The pn Junction and pin Photodiodes 408
      Example 5.12.1 NEP of a Si pin photodiode 412
Example 5.12.2 Noise of an ideal photodetector 412
Example 5.12.3 SNR of a receiver 413
B. Avalanche Noise in the APD 414
Example 5.12.4 Noise in an APD 414

5.13 Image Sensors 415
A. Basic Principles 415
B. Active Matrix Array and CMOS Image Sensors 417
C. Charge-Coupled Devices 419

Additional Topics 421

5.14 Photovoltaic Devices: Solar Cells 421
A. Basic Principles 421
B. Operating Current and Voltage, and Fill Factor 423
C. Equivalent Circuit of a Solar Cell 424
D. Solar Cell Structures and Efficiencies 426
   Example 5.14.1 Solar cell driving a load 428
   Example 5.14.2 Open circuit voltage and short circuit current 429
Questions and Problems 429

Chapter 6 Polarization and Modulation of Light 441

6.1 Polarization 441
A. State of Polarization 441
   Example 6.1.1 Elliptical and circular polarization 444
B. Malus’s Law 444

6.2 Light Propagation in an Anisotropic Medium: Birefringence 445
A. Optical Anisotropy 445
B. Uniaxial Crystals and Fresnel’s Optical Indicatrix 447
C. Birefringence of Calcite 450
D. Dichroism 451

6.3 Birefringent Optical Devices 452
A. Retarding Plates 452
   Example 6.3.1 Quartz-half wave plate 453
   Example 6.3.2 Circular polarization from linear polarization 454
B. Soleil–Babinet Compensator 454
C. Birefringent Prisms 455

6.4 Optical Activity and Circular Birefringence 456

6.5 Liquid Crystal Displays 458

6.6 Electro-Optic Effects 462
A. Definitions 462
B. Pockels Effect 463
   Example 6.6.1 Pockels Cell Modulator 468
C. Kerr Effect 468
   Example 6.6.2 Kerr Effect Modulator 470
6.7 Integrated Optical Modulators 470
   A. Phase and Polarization Modulation 470
   B. Mach-Zehnder Modulator 471
   C. Coupled Waveguide Modulators 473
      Example 6.7.1 Modulated Directional Coupler 476
6.8 Acousto-Optic Modulator 476
   A. Photoelastic Effect and Principles 476
   B. Acousto-Optic Modulators 478
      Example 6.8.1 AO Modulator 483
6.9 Faraday Rotation and Optical Isolators 483
      Example 6.9.1 Faraday rotation 484
6.10 Nonlinear Optics and Second Harmonic Generation 485
Additional Topics 489
6.11 Jones Vectors 489
      Questions and Problems 490

Appendices
   Appendix A Gaussian Distribution 498
   Appendix B Solid Angles 500
   Appendix C Basic Radiometry and Photometry 502
   Appendix D Useful Mathematical Formulae 505
   Appendix E Notation and Abbreviations 507
