Help students learn physics by doing physics

Dear Colleague,

Welcome to the second edition of our textbook *College Physics: Explore and Apply* and its supporting materials (Mastering™ Physics, the *Active Learning Guide* (ALG), and our *Instructor's Guide*)—a coherent learning system that helps students **learn physics by doing physics**!

Experiments, experiments… Instead of being presented physics as a static set of established concepts and mathematical relations, students develop their own ideas just as physicists do: they *explore* and analyze **observational experiments**, identify patterns in the data, and propose explanations for the patterns. They then design **testing experiments** whose outcomes either confirm or contradict their explanations. Once tested, students *apply* explanations and relations for practical purposes and to problem solving.

A physics tool kit To build problem-solving skills and confidence, students master proven visual tools (representations such as motion diagrams and energy bar charts) that serve as bridges between words and abstract mathematics and that form the basis of our overarching problem-solving strategy. Our unique and varied problems and activities promote 21st-century competences such as evaluation and communication and reinforce our practical approach with photo, video, and data analysis and real-life situations.

A flexible learning system Students can work collaboratively on ALG activities in class (lectures, labs, and problem-solving sessions) and then read the textbook at home and solve end-of-chapter problems, or they can read the text and do the activities using Mastering Physics at home, then come to class and discuss their ideas. However they study, students will see physics as a living thing, a process in which they can participate as equal partners.

Why a new edition? With a wealth of feedback from users of the first edition, our own ongoing experience and that of a gifted new co-author, and changes in the world in general and in education in particular, we embarked on this second edition in order to refine and strengthen our experiential learning system. Experiments are more focused and effective, our multiple-representation approach is expanded, topics have been added or moved to provide more flexibility, the writing, layout, and design are streamlined, and all the support materials are more tightly correlated to our approach and topics.

Working on this new edition has been hard work, but has enriched our lives as we've explored new ideas and applications. We hope that using our textbook will enrich the lives of your students!

Eugenia Etkina

Gorazd Planinsic

Alan Van Heuvelen

"This book made me think deeper and understand better."

—student at Horry Georgetown Technical College

A unique and active learning approach promotes deep and lasting

OBSERVATIONAL EXPERIMENT TABLE 3.6 Forces that two dynamics carts exert on each other

VIDEO OET 3.6

Observational experiment	Analysis
Experiment 1. Two carts of different masses move toward each other on a level track. A motion detector indicates their speed before the collision, and force probes record the forces exerted by each cart on the other. Before the collision: $m_1 = 1.0\text{ kg},\ v_{1x} = +2\text{ m/s}$ $m_2 = 0.5\text{ kg},\ v_{2x} = -2\text{ m/s}$ 	Because both carts changed velocities due to the collision, they must have exerted forces on each other. The computer recordings from the force probes show that the forces that the carts exert on each other vary with time and at each time have the same magnitude and point in opposite directions. Cart 1 exerts a force on cart 2 toward the right, and cart 2 exerts a force on cart 1 toward the left. Experiment 2. Cart masses and velocities before collision: $m_1 = 1.0\text{ kg},\ v_{1x} = 0\text{ m/s}$ (at rest) $m_2 = 0.5\text{ kg},\ v_{2x} = -1\text{ m/s}$ 	Although the forces that the carts exert on each other are smaller than in the first experiment, the magnitudes of the forces at each time are still the same. Experiment 3. Cart masses and velocities before collision: $m_1 = 1.0\text{ kg},\ v_{1x} = +2\text{ m/s}$ $m_2 = 0.5\text{ kg},\ v_{2x} = -1\text{ m/s}$ 	The same analysis applies. 
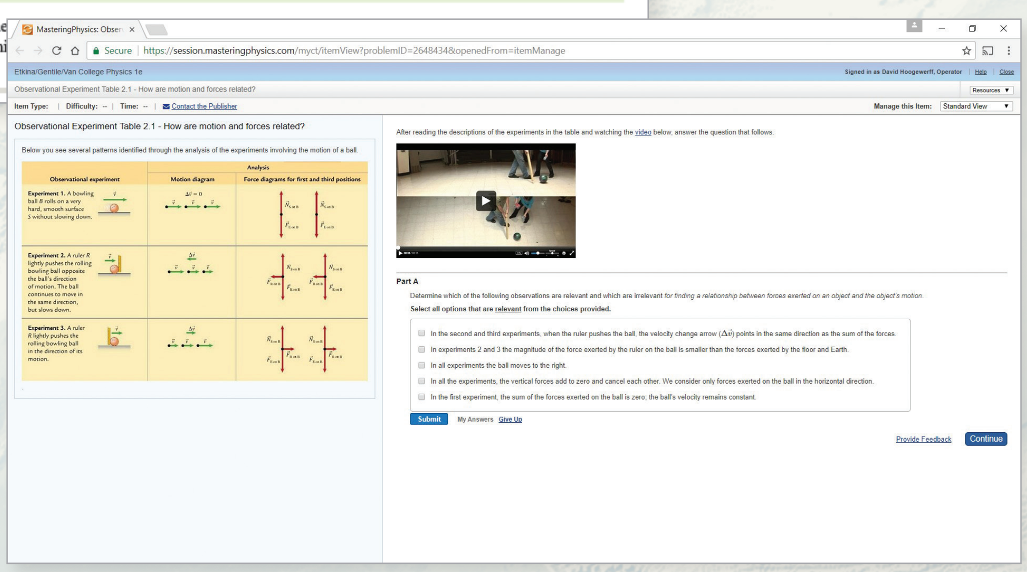
Pattern

In each experiment, independent of the masses and velocitie[s] force that cart 1 exerted on cart 2 $\vec{F}_{1\text{ on }2}$ had the same magni[...] cart 1 $\vec{F}_{2\text{ on }1}$.

UPDATED! Observational Experiment Tables and Testing Experiment Tables: Students must make observations, analyze data, identify patterns, test hypotheses, and predict outcomes. Redesigned for clarity in the second edition, these tables encourage students to explore science through active discovery and critical thinking, constructing robust conceptual understanding.

NEW! Digitally Enhanced Experiment Tables now include embedded videos in the Pearson eText for an interactive experience. Accompanying questions are available in Mastering Physics to build skills essential to success in physics.



conceptual understanding of physics and the scientific process

TESTING EXPERIMENT TABLE 4.6 Testing the independence of horizontal and vertical motions

VIDEO TET 4.6

Testing experiment	Prediction	Outcome
At time zero, ball 1 is dropped. Simultaneously, ball 2 is shot horizontally when a compressed spring is released. Which ball hits the surface first? 	Both balls start with zero initial vertical speed; thus their vertical motions are identical. Since we think that the vertical motion is independent of the horizontal motion, we predict that they will land at the same time.	When we try the experiment, the balls do land at the same time.

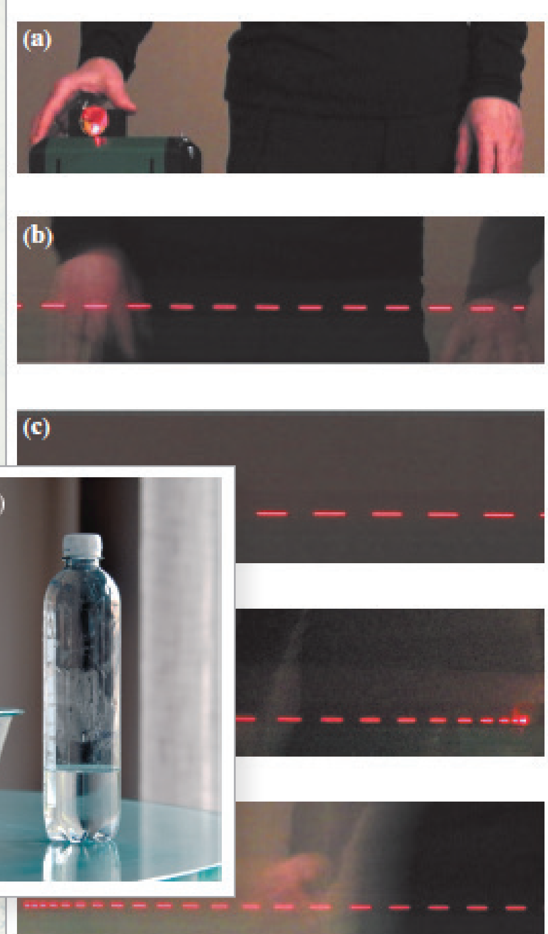
Conclusion

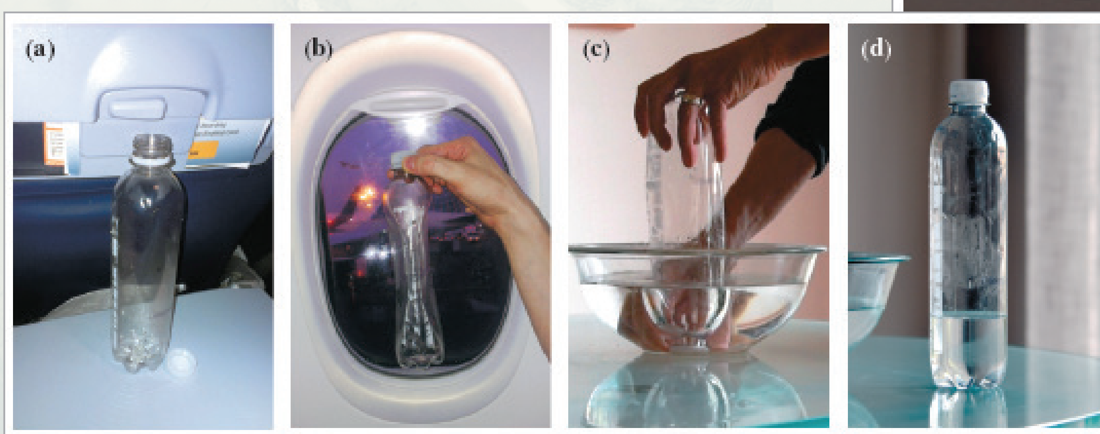
The outcome supports the hypothesis that horizontal and vertical motions are independent of each other.

> *"I like that the experiment tables… explain in detail why every step was important."*
>
> —student at *Mission College*

EXPANDED! Experiment videos and photos created by the authors enhance the active learning approach. Approximately 150 photos and 40 videos have been added to the textbook, as well as embedded in the Pearson eText, and scores more in the *Active Learning Guide* (ALG).

FIGURE 2.2 Long-exposure photographs of a moving cart with a blinking LED.





A wealth of practical and consistent guidance, examples, and opportunities

PROBLEM-SOLVING STRATEGY 14.1 Applying Bernoulli's equation

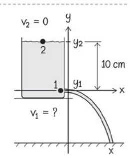
EXAMPLE 14.2 Removing a tack from a water bottle

What is the speed with which water flows from a hole punched in the side of an open plastic bottle? The hole is 10 cm below the water surface.

Sketch and translate

- Sketch the situation. Include an upward-pointing y-coordinate axis. Choose an origin and positive direction for the coordinate axis.
- Choose points 1 and 2 at positions in the fluid where you know the pressure/speed/position or that involve the quantity you are trying to determine.
- Choose a system.

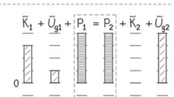
- Choose the origin of the vertical y-axis to be the location of the hole.
- Choose position 1 to be the place where the water leaves the hole and position 2 to be a place where the pressure, elevation, and water speed are known—at the water surface $y_2 = 0.10$ m. The pressure in Bernoulli's equation at both positions 1 and 2 is atmospheric pressure, since both positions are exposed to the atmosphere ($P_1 = P_2 = P_{atm}$).
- Choose Earth and the water as the system.



Simplify and diagram

- Identify any assumptions you are making. For example, can we assume that there are no resistive forces exerted on the flowing fluid?
- Construct a Bernoulli bar chart.

- Assume that no resistive forces are exerted on the flowing fluid.
- Assume that y_2 and y_1 stay constant during the process, since the elevation of the surface decreases slowly compared to the speed of the water as it leaves the tiny hole.
- Because the water at the surface is moving very slowly relative to the hole, assume that $v_2 = 0$.
- Draw a bar chart that represents the process.



Represent mathematically

- Use the sketch and bar chart to help apply Bernoulli's equation.
- You may need to combine Bernoulli's equation with other equations, such as the equation of continuity $Q = v_1A_1 = v_2A_2$ and the definition of pressure $P = F/A$.

- We see from the sketch and the bar chart that the speed of the fluid at position 2 is zero (zero kinetic energy density) and that the elevation is zero at position 1 (zero gravitational potential energy density). Also, the pressure is atmospheric at both 1 and 2. Thus

$$\tfrac{1}{2}\rho(0)^2 + \rho g y_2 + P_{atm} = P_{atm} + \tfrac{1}{2}\rho v_1^2 + \rho g(0)$$
$$\Rightarrow \rho g y_2 = \tfrac{1}{2}\rho v_1^2$$

Solve and evaluate

- Solve the equations for an unknown quantity.
- Evaluate the results to see if they are reasonable (the magnitude of the answer, its unit, how the answer changes in limiting cases, and so forth).

- Solve for v_1:

$$v_1 = \sqrt{2gy_2}$$

Substituting for g and y_2, we find that

$$v_1 = \sqrt{2(9.8\ \text{m/s}^2)(0.10\ \text{m})} = 1.4\ \text{m/s}$$

- The unit m/s is the correct unit for speed. The magnitude seems reasonable for water streaming from a bottle (if we obtained 120 m/s it would be unreasonably high).

Try it yourself In the above situation the water streams out of the bottle onto the floor a certain horizontal distance away from the bottle. The floor is 1.0 m below the hole. Predict this horizontal distance using your knowledge of projectile motion. (Hint: Use Eqs. (4.7) and (4.8).)

Answer The equations yield a result of 0.63 m. However, if we were to actually perform this experiment with a tack-sized hole, the water would land short of our prediction because of resistive forces exerted by the hole on the water. In order to make the water land closer to 0.63 m from the bottle, we must increase the diameter of the hole. We discuss the effect of resistive forces on fluid flow later in the chapter.

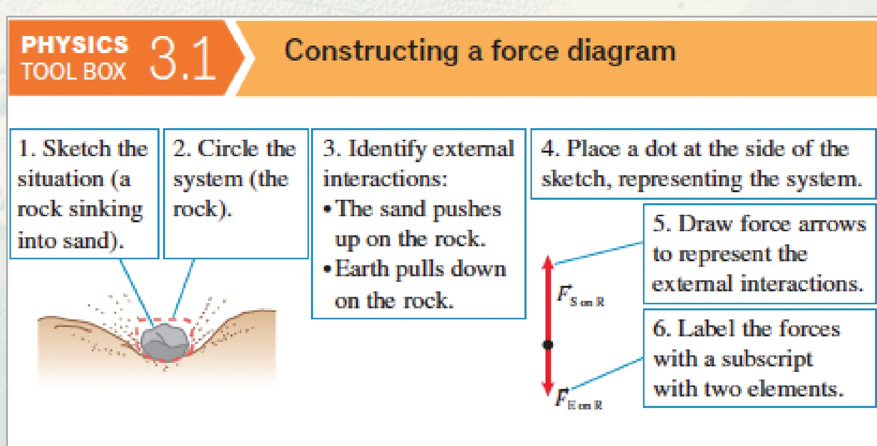
A four-step problem-solving approach in worked examples

consistently uses multiple representations to teach students how to solve complex physics problems. Students follow the steps of **Sketch & Translate, Simplify & Diagram, Represent Mathematically, Solve & Evaluate** to translate a problem statement into the language of physics, sketch and diagram the problem, represent it mathematically, solve the problem, and evaluate the result.

Physics Tool Boxes focus on a particular skill, such as drawing a motion diagram, force diagram, or work-energy bar chart, to help students master the key tools they will need to utilize throughout the course to analyze physics processes and solve problems, bridging real phenomena and mathematics.

"It made me excited to learn physics! It has a systematic and easy-to-understand method for solving problems."

—student at State University of West Georgia



for practice help develop confidence and higher-level reasoning skills

56. * A frog jumps at an angle 30° above the horizontal. The origin of the coordinate system is at the point where the frog leaves the ground. Complete Table P4.55 by drawing check marks in the cells that correctly connect the quantities in the first column that describe the motion of the frog and the descriptions of what is happening to these quantities while the frog is moving. Consider the frog as a point-like object and assume that the resistive force exerted by the air is negligible.

TABLE P4.55

Physical quantity	Remains constant	Is changing	Increases only	Decreases only	Increases, then decreases	Decreases, then increases
x-coordinate magnitude						
y-coordinate magnitude						
Direction of velocity						
Magnitude of velocity						
Direction of acceleration						
Magnitude of acceleration						

29. * Your friend Devin has to solve the following problem: "You have a spring with spring constant k. You compress it by distance x and use it to shoot a steel ball of mass m into a sponge of mass M. After the collision, the ball and the sponge move a distance s along a rough surface and stop (see Figure P7.29). The coefficient of friction between the sponge and the surface is μ. Derive an expression that shows how the distance s depends on relevant physical quantities."

FIGURE P7.29

Devin derived the following equation:

$$s = \frac{kmx^2}{2(m+M)^2 g\mu}$$

Without deriving it, evaluate the equation that … reasonable? How do you know?

NEW! Problem types include multiple choice with multiple correct answers, find-a-pattern in data presented in a video or a table, ranking tasks, evaluate statements/claims/explanations/measuring procedures, evaluate solutions, design a device or a procedure that meets given criteria, and linearization problems, promoting critical thinking and deeper understanding.

"It helps break down the problems, which makes them look less daunting when compared to paragraphs of explanations. It is very straightforward."

—student at *Case Western Reserve University*

59. * Jeff and Natalie notice that a rubber balloon, which is first in a warm room, shrinks when they take it into the garden on a cold winter day. They propose two different explanations for the observed phenomenon: (a) the balloon is slowly leaking; (b) the balloon shrinks due to decreased temperature while the pressure in the balloon remains constant (isobaric compression). In order to test their proposed explanations, Jeff and Natalie perform three consecutive experiments: they measure the volume of the balloon and the temperature of the air near the balloon (1) in the room, (2) in the garden, and (3) again in the room. Their measurements, including uncertainties, are presented in the table below.

Exp. #	Location	Temperature	Volume of the balloon
1	Room	26.2 °C ± 0.1 °C	7500 cm³ ± 400 cm³
2	Garden	−15.3 °C ± 0.1 °C	6400 cm³ ± 400 cm³
3	Room	26.2 °C ± 0.1 °C	7300 cm³ ± 400 cm³

Based on the data, can Jeff and Natalie reject any of their hypotheses? Explain. Make sure you include uncertainties in your answer.

Pedagogically driven design and content changes

NEW! A fresh and modern design with a more transparent hierarchy of features and navigation structure, as well as an engaging chapter opener page and streamlined chapter summary, result in a more user-friendly resource, both for learning and for reference.

12

Gases

- Why does a plastic bottle left in a car overnight look crushed on a chilly morning?
- How hard is air pushing on your body?
- How long can the Sun shine?

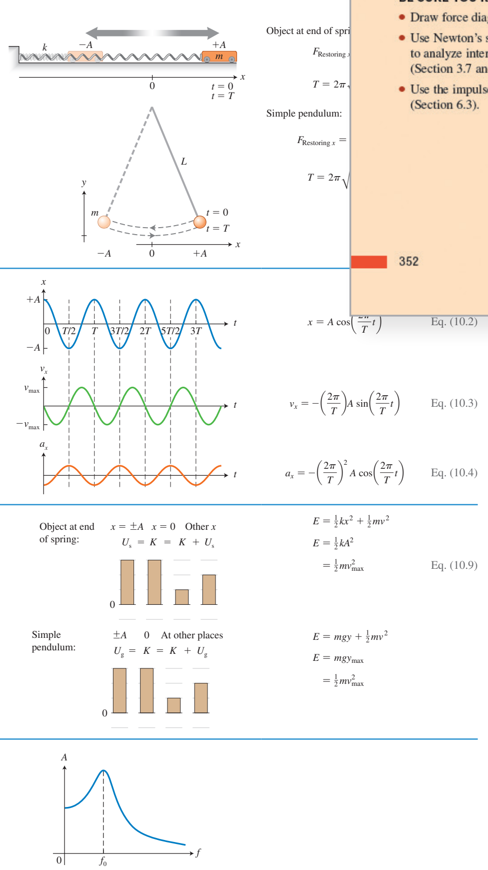
When you inflate the tires of your bicycle in a warm basement in winter, they tend to look a bit flat when you take the bike outside. The same thing happens to a basketball—you need to pump it up before playing outside on a cold day. An empty plastic bottle left in a car looks crushed on a chilly morning. What do all those phenomena have in common, and how do we explain them?

BE SURE YOU KNOW HOW TO:

- Draw force diagrams (Section 3.1).
- Use Newton's second and third laws to analyze interactions of objects (Section 3.7 and 3.8).
- Use the impulse-momentum principle (Section 6.3).

IN CHAPTER 11, we learned that sound propagates due to the compression and decompression of air. But what exactly is being compressed? To answer this question and the ones above, we need to investigate what makes up a gas and how certain properties of gases can change.

352



308 CHAPTER 10 Vibrational Motion

Summary

Vibrational motion is the repetitive movement of an object back and forth about an **equilibrium position**. This vibration is due to the **restoring force** exerted by another object that tends to return the first object to its equilibrium position. An object's maximum displacement from equilibrium is the **amplitude** A of the vibration. **Period** T is the time interval for one complete vibration, and **frequency** f is the number of complete vibrations per second (in hertz). The frequency is the inverse of the period. (Section 10.1)

Simple harmonic motion is a mathematical model of vibrational motion when position x, velocity v, and acceleration a of the vibrating object change as sine or cosine functions with time. (Section 10.2)

$v_x = -\left(\frac{2\pi}{T}\right)A\sin\left(\frac{2\pi}{T}t\right)$ Eq. (10.3)

$a_x = -\left(\frac{2\pi}{T}\right)^2 A\cos\left(\frac{2\pi}{T}t\right)$ Eq. (10.4)

The **energy of a spring-object system** vibrating horizontally converts continuously from elastic potential energy when at the extreme positions to maximum kinetic energy when passing through the equilibrium position to a combination of energy types at other positions. (Section 10.3)

$E = \frac{1}{2}kx^2 + \frac{1}{2}mv^2$

$E = \frac{1}{2}kA^2$

$= \frac{1}{2}mv^2_{max}$ Eq. (10.9)

The **energy of a pendulum-Earth system** converts continuously from gravitational potential energy when it is at the maximum height of a swing to kinetic energy when it is passing through the lowest point in the swing to a combination of energy types at other positions. (Section 10.5)

$E = mgy + \frac{1}{2}mv^2$

$E = mgy_{max}$

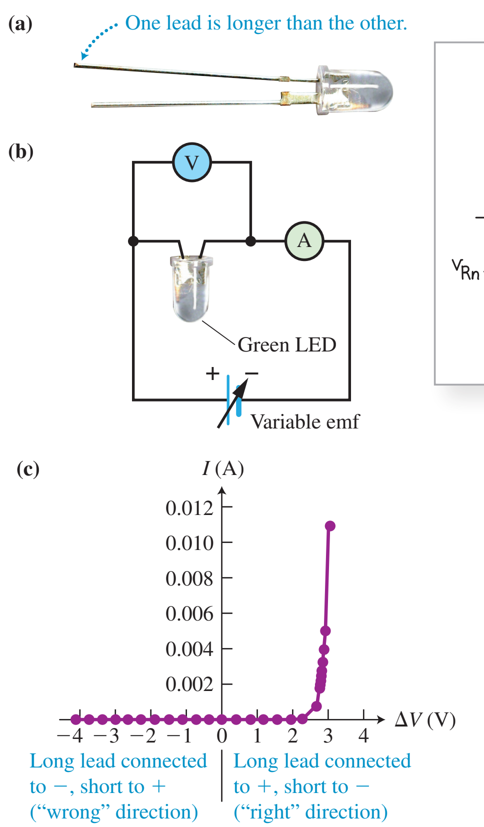
$= \frac{1}{2}mv^2_{max}$

Resonant energy transfer occurs when the frequency of the variable external force driving the oscillations is close to the **natural frequency** f_0 of the vibrating system. (Section 10.8)

REVISED! Streamlined text, layout, and figures throughout the book enhance the focus on central themes and topics, eliminating extraneous detail, resulting in **over 150 fewer pages** than the first edition and allowing students to study more efficiently.

enhance ease of use for students and instructors alike

FIGURE 19.14 A green LED. The electric circuit in (b) is used to collect the I-versus-ΔV data plotted in (c).



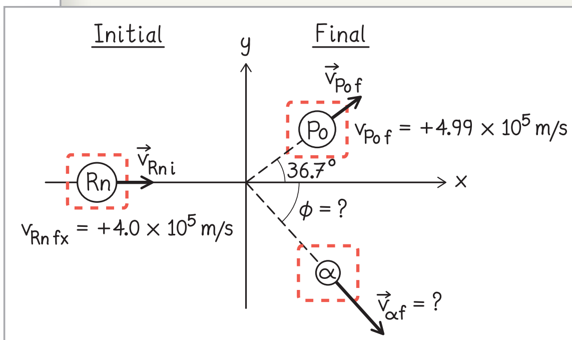


FIGURE 26.11 World lines for two objects and two light beams drawn on a spacetime diagram.

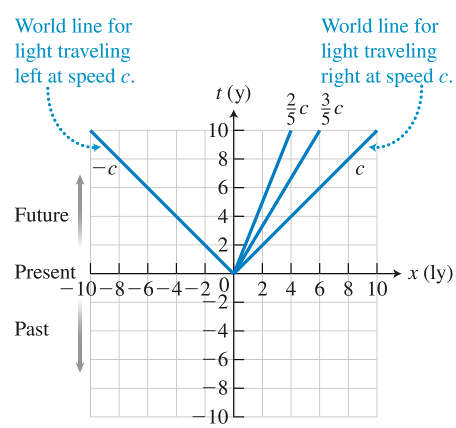
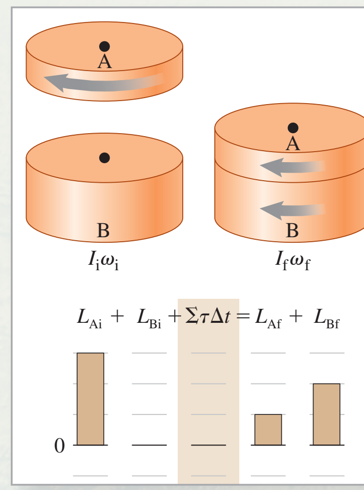


NEW, REVISED, and EXPANDED! Topics include capacitors, AC circuits, LEDs, friction, 2-D collisions, energy, bar charts for rotational momentum and nuclear energy, ideal gas processes, thermodynamic engines, semiconductors, velocity selectors, and spacetime diagrams in special relativity.



NEW! Integration of vector arithmetic into early chapters helps students develop vector-related skills in the context of learning physics. **Earlier placement of waves and oscillations** allows instructors to teach these topics with mechanics if preferred. Coverage with optics is also possible.

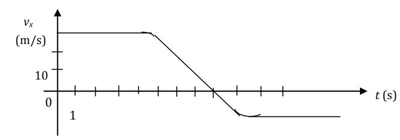
A flexible learning system adapts to any method of instruction

2.9.9 Evaluate the solution

Class: *Equipment per group: whiteboard and markers*

Discuss with your group: Identify any errors in the proposed solution to the following problem and provide a corrected solution if there are errors.

Problem: Use the graphical representation of motion to determine how far the object travels until it stops.

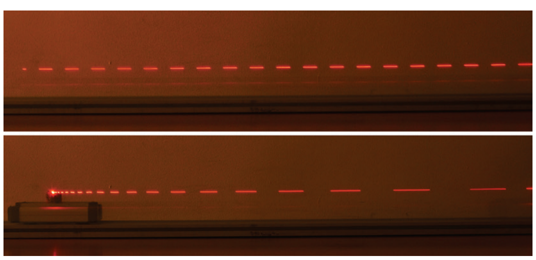


Proposed solution The object was at rest for about 5 seconds, then started moving in the negative direction and stopped after about 9 seconds. During this time its position changed from 30 m to – 10 m, so the total distance that it traveled was 40 m.

2.9.10 Observe and analyze

Class: *Equipment per group: whiteboard and markers*

Collaborate together with your group to figure this out: The figure below shows long exposure photos of two experiments with a blinking LED that was fixed on a moving cart. In both cases the cart was moving from right to left. The duration of the ON and OFF time for LED is 154 ms and the length of the cart is 17 cm. a) Specify the coordinate system and draw a qualitative velocity-time graph for the motion of the cart in both experiments; b) estimate the speed of the cart in the first experiment. Both photos were obtained from the same spot and with the same settings. Indicate any assumptions that you made.



REVISED! The **Active Learning Guide** aligns with the textbook's chapters and supplements the knowledge-building approach of the textbook with activities that provide opportunities for further observation, testing, sketching, and analysis as well as collaboration, scientific reasoning, and argumentation. The *Active Learning Guide* can be used in class for individual or group work or assigned as homework and is now better integrated with the text. Now available via download in the Mastering Instructor Resource Center and customizable in print form via Pearson Collections.

> *"It is much easier to understand a concept when you can see it in action, and not just read it."*
>
> —student at *San Antonio College*

The **Instructor's Guide** provides key pedagogical principles of the textbook and elaborates on the implementation of the methodology used in the textbook, providing guidance on how to integrate the approach into your course.

2

Kinematics: Motion in One Dimension

In Chapter 2, students will learn to describe motion using sketches, motion diagrams, graphs, and algebraic equations. The chapter subject matter is broken into four parts:

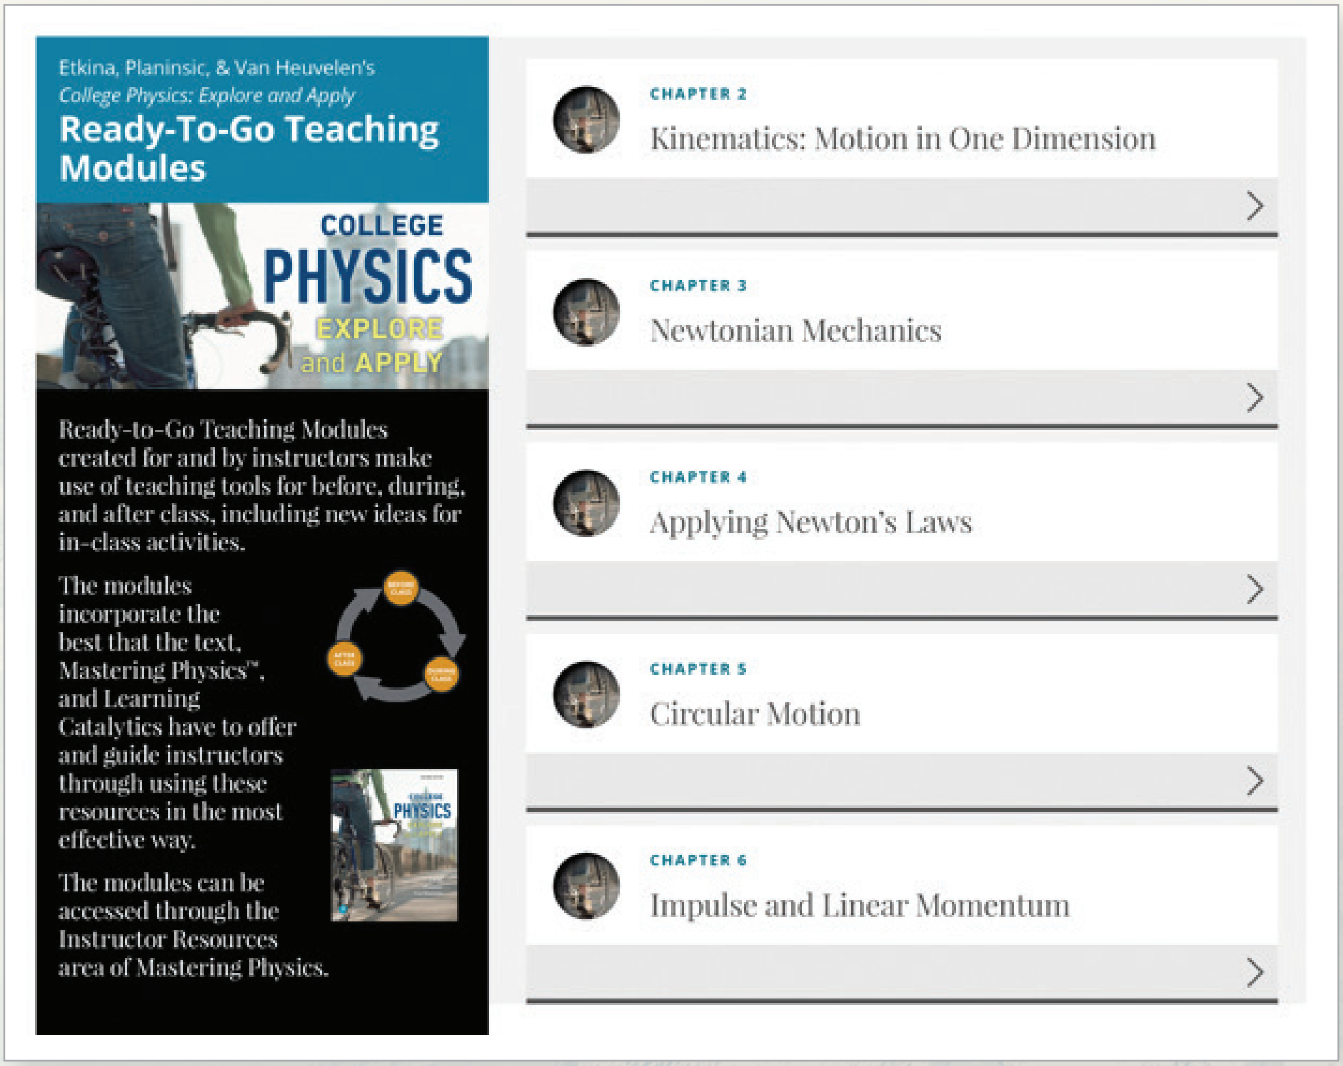
I. *What is motion and how do we describe it qualitatively?*
II. *Some of the quantities used to describe motion and a graphical description of motion*
III. *Use of the above to describe constant velocity and constant acceleration motion*
IV. *Developing and using the skills needed to analyze motion in real processes*

For each part, we provide examples of activities that can be used in the classroom, brief discussions of why we introduce the content in a particular order and use of these activities to support the learning, and common student difficulties.

Chapter subject matter	Related textbook section	ALG activities	End-of-chapter questions and problems	Videos
What is motion and how do we describe it qualitatively?	2.1, 2.2	2.1.1–2.1.6, 2.2.1–2.2.4	Problems 1, 3	OET 2.1

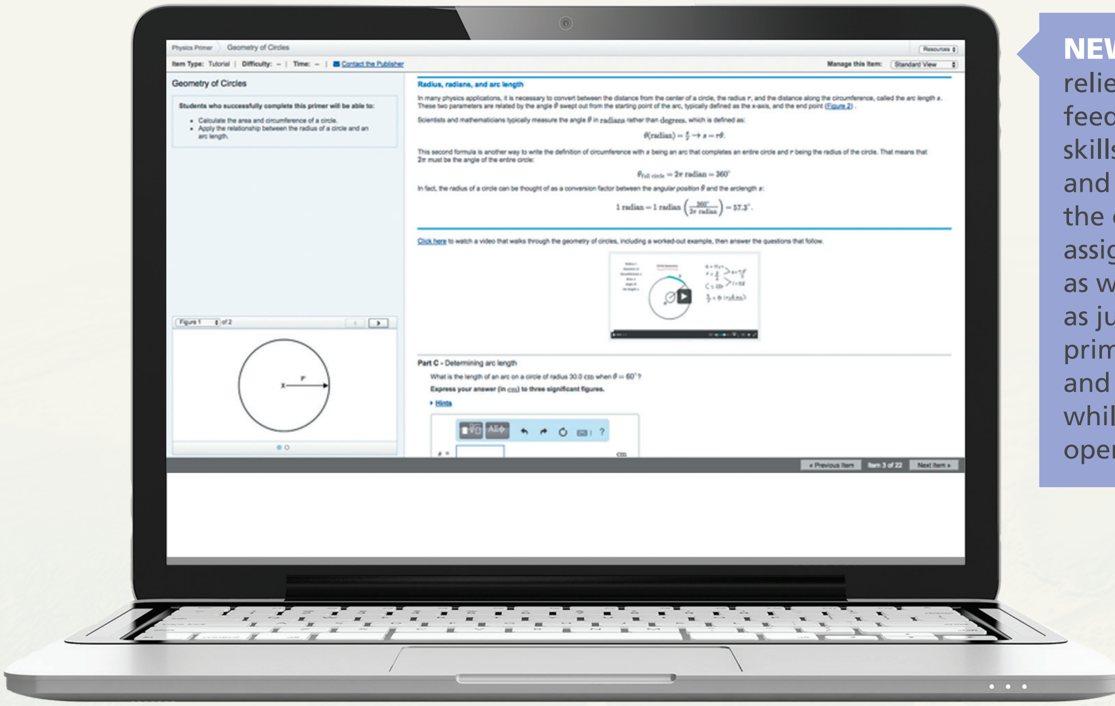
and provides tools for easy implementation

NEW! Ready-to-Go Teaching Modules created for and by instructors make use of teaching tools for before, during, and after class, including new ideas for in-class activities. The modules incorporate the best that the text, Mastering Physics, and Learning Catalytics have to offer and guide instructors through using these resources in the most effective way. The modules can be accessed through the Instructor Resources area of Mastering Physics and as pre-built, customizable assignments.



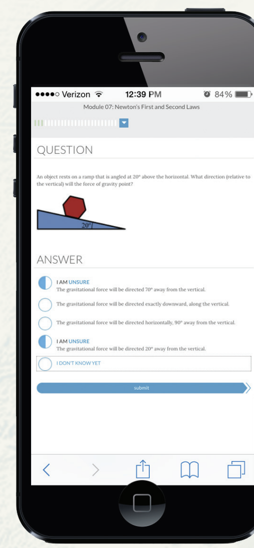
Mastering Physics

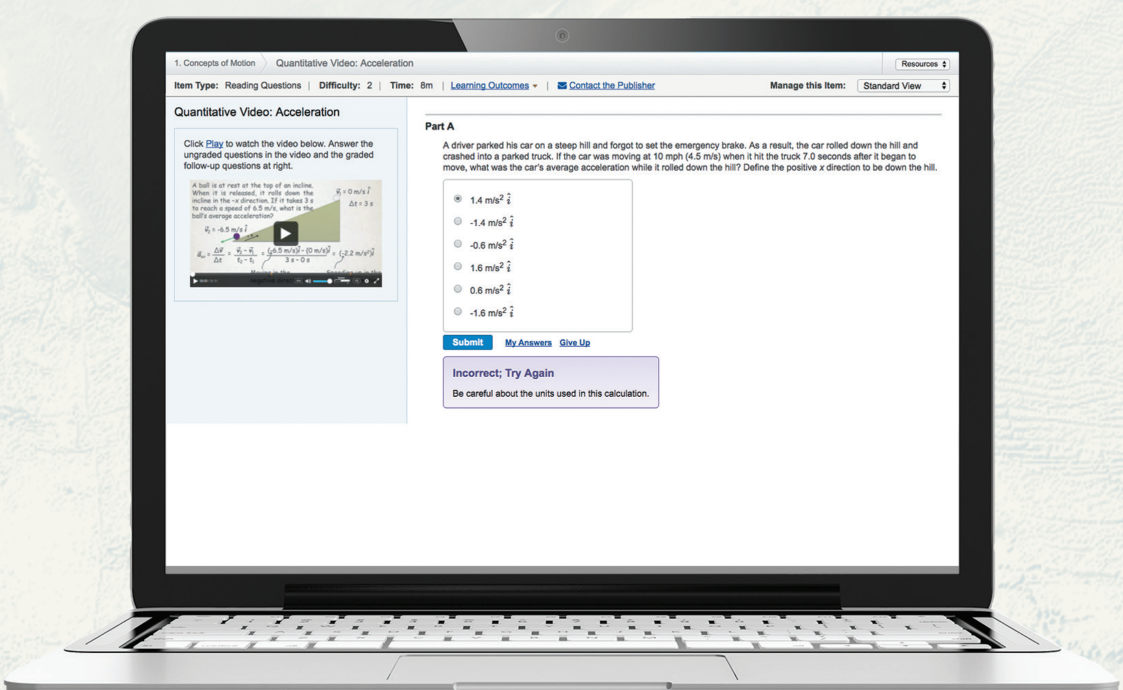
Build a basic understanding of physics principles and math skills



NEW! The Physics Primer relies on videos, hints, and feedback to refresh students' math skills in the context of physics and prepare them for success in the course. These tutorials can be assigned before the course begins as well as throughout the course as just-in-time remediation. The primer ensures students practice and maintain their math skills, while tying together mathematical operations and physics analysis.

Interactive Animated Videos provide an engaging overview of key topics with embedded assessment to help students check their understanding and to help professors identify areas of confusion. Note that these videos are not tied to the textbook and therefore do not use the language, symbols, and conceptual approaches of the book and ALG. The authors therefore recommend assigning these videos after class to expose students to different terminology and notation that they may come across from other sources.

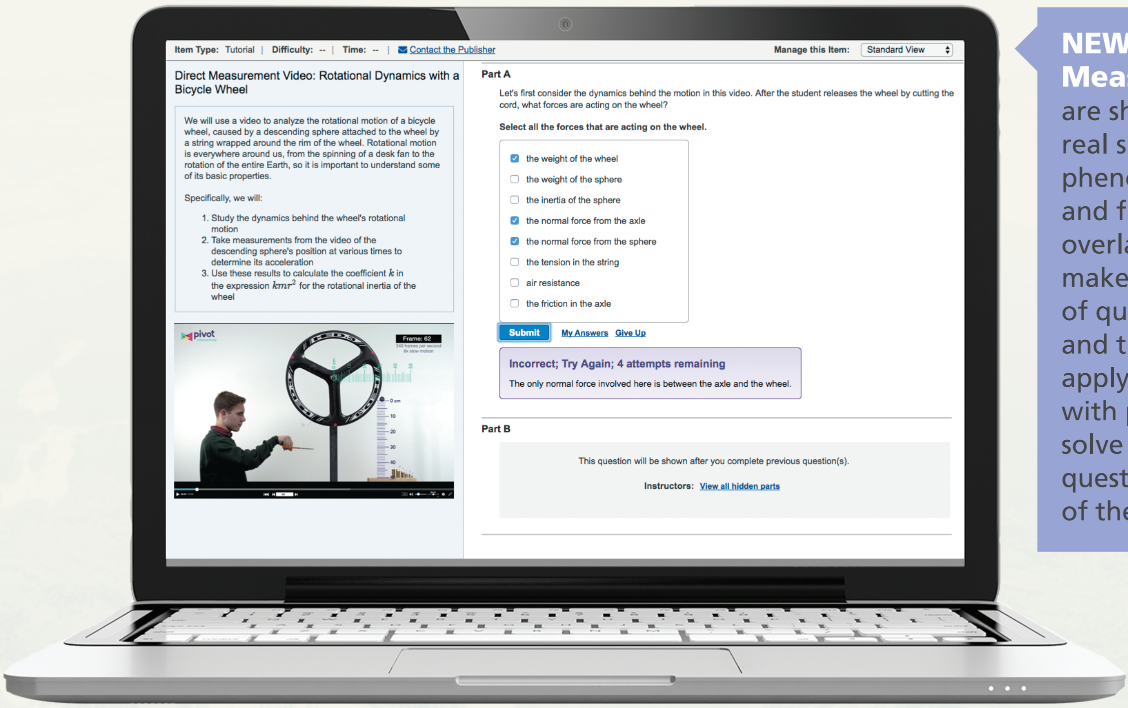




Dynamic Study Modules (DSMs) help students study effectively on their own by continuously assessing their activity and performance in real time and adapting to their level of understanding. The content focuses on definitions, units, and the key relationships for topics across all of mechanics and electricity and magnetism.

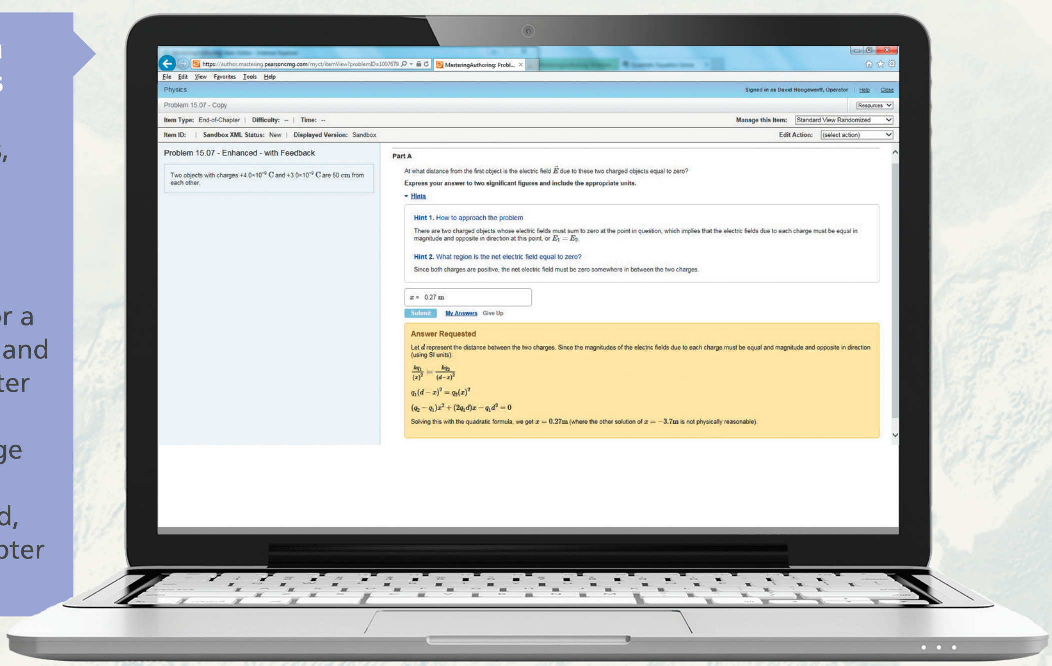
www.MasteringPhysics.com

Show connections between physics and the real world as students learn to apply physics concepts via enhanced media

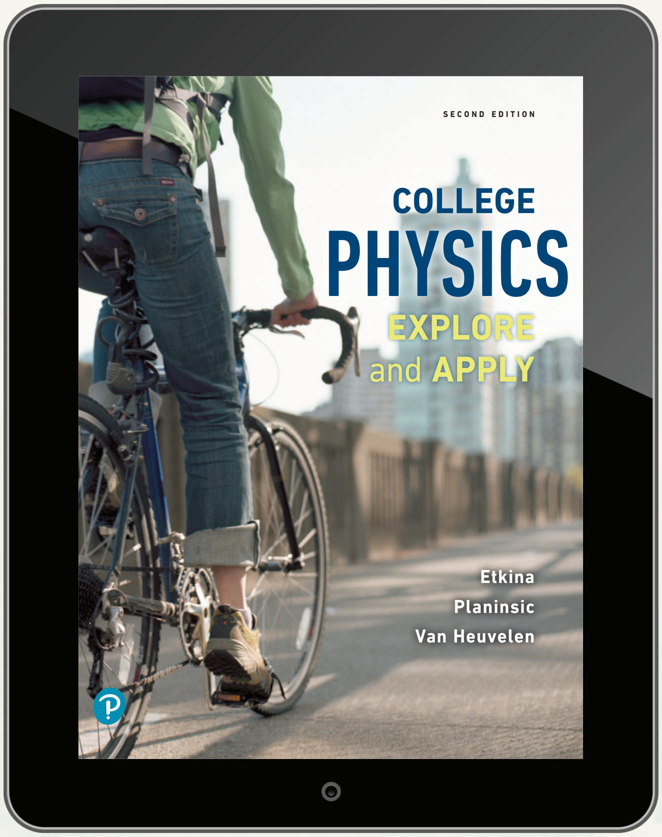


NEW! Direct Measurement Videos are short videos that show real situations of physical phenomena. Grids, rulers, and frame counters appear as overlays, helping students to make precise measurements of quantities such as position and time. Students then apply these quantities along with physics concepts to solve problems and answer questions about the motion of the objects in the video.

NEW! End-of-chapter problem types and 15% new questions and problems include multiple choice with multiple correct answers, find-a-pattern in data presented in a video or a table, ranking tasks, evaluate statements/claims/explanations/measuring procedures, evaluate solutions, design a device or a procedure that meets given criteria, and linearization problems. End-of-chapter problems have undergone careful analysis using Mastering Physics usage data to provide fine-tuned difficulty ratings and to produce a more varied, useful, and robust set of end-of-chapter problems.

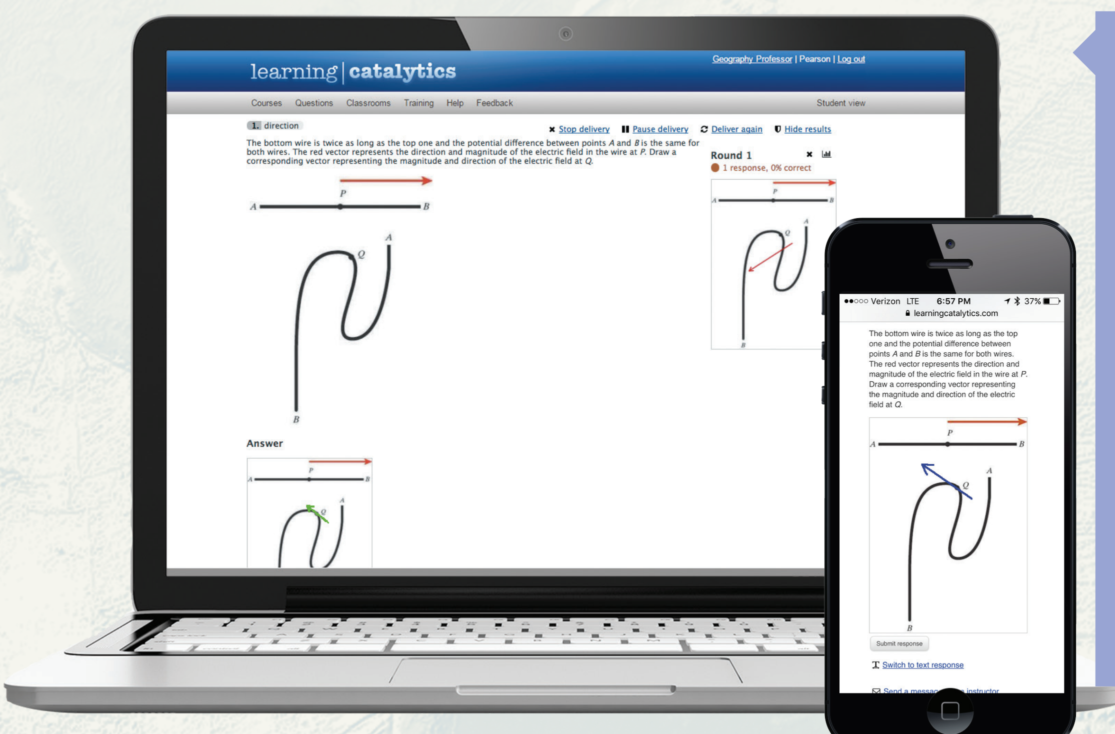


Give students fingertip access to interactive tools



NEW! Pearson eText, optimized for mobile, seamlessly integrates videos such as the Observational Experiment Tables and other rich media with the text and gives students access to their textbook anytime, anywhere. Pearson eText is available with Mastering Physics when packaged with new books or as an upgrade students can purchase online.

Learning Catalytics™ helps generate class discussion, customize lectures, and promote peer-to-peer learning with real-time analytics. Learning Catalytics acts as a student response tool that uses students' smartphones, tablets, or laptops to engage them in more interactive tasks and thinking.



- **NEW!** Upload a full PowerPoint® deck for easy creation of slide questions.
- **NEW!** Team names are no longer case sensitive.
- Help your students develop critical thinking skills.
- Monitor responses to find out where your students are struggling.
- Rely on real-time data to adjust your teaching strategy.
- Automatically group students for discussion, teamwork, and peer-to-peer learning.

About the Authors

EUGENIA ETKINA is a Distinguished Professor at Rutgers, the State University of New Jersey. She holds a PhD in physics education from Moscow State Pedagogical University and has more than 35 years of experience teaching physics. She is a recipient of the 2014 Millikan Medal, awarded to educators who have made significant contributions to teaching physics, and is a fellow of the AAPT. Professor Etkina designed and now coordinates one of the largest programs in physics teacher preparation in the United States, conducts professional development for high school and university physics instructors, and participates in reforms to the undergraduate physics courses. In 1993 she developed a system in which students learn physics using processes that mirror scientific practice. That system, called *Investigative Science Learning Environment* (ISLE), serves as the basis for this textbook. Since 2000, Professor Etkina has conducted over 100 workshops for physics instructors, and she co-authored the first edition of *College Physics* and the *Active Learning Guide*. Professor Etkina is a dedicated teacher and an active researcher who has published over 60 peer-refereed articles.

GORAZD PLANINSIC is a Professor of Physics at the University of Ljubljana, Slovenia. He has a PhD in physics from the University of Ljubljana. Since 2000 he has led the Physics Education program, which prepares almost all high school physics teachers in the country of Slovenia. He started his career in MRI physics and later switched to physics education research. During the last 10 years, his work has mostly focused on the research of new experiments and how to use them more productively in teaching and learning physics. He is co-founder of the Slovenian hands-on science center House of Experiments. Professor Planinsic is co-author of more than 80 peer-refereed research articles and more than 20 popular science articles, and is the author of a university textbook for future physics teachers. In 2013 he received the Science Communicator of the Year award from the Slovenian Science Foundation.

ALAN VAN HEUVELEN holds a PhD in physics from the University of Colorado. He has been a pioneer in physics education research for several decades. He taught physics for 28 years at New Mexico State University, where he developed active learning materials including the *Active Learning Problem Sheets* (the *ALPS Kits*) and the *ActivPhysics* multimedia product. Materials such as these have improved student achievement on standardized qualitative and problem-solving tests. In 1993 he joined Ohio State University to help develop a physics education research group. He moved to Rutgers University in 2000 and retired in 2008. For his contributions to national physics education reform, he won the 1999 AAPT Millikan Medal and was selected a fellow of the American Physical Society. Over the span of his career he has led over 100 workshops on physics education reform. He worked with Professor Etkina in the development of the *Investigative Science Learning Environment* (ISLE) and co-authored the first edition of *College Physics* and the *Active Learning Guide*.

Preface

To the student

College Physics: Explore and Apply is more than just a book. It's a learning *companion*. As a companion, the book won't just tell you about physics; it will act as a guide to help you build physics ideas using methods similar to those that practicing scientists use to construct knowledge. The ideas that you build will be *yours*, not just a copy of someone else's ideas. As a result, the ideas of physics will be much easier for you to use when you need them: to succeed in your physics course, to obtain a good score on exams such as the MCAT, and to apply to everyday life.

Although few, if any, textbooks can honestly claim to be a pleasure to read, *College Physics: Explore and Apply* is designed to make the process interesting and engaging. The physics you learn in this book will help you understand many real-world phenomena, from why giant cruise ships are able to float to how telescopes work. The cover of the book communicates its spirit: you learn physics by exploring the natural world and applying it in your everyday life.

A great deal of research has been done over the past few decades on how students learn. We, as teachers and researchers, have been active participants in investigating the challenges students face in learning physics. We've developed unique strategies that have proven effective in helping students think like physicists. These strategies are grounded in *active learning with your peers*—deliberate, purposeful action on your part to learn something new. For learning to happen, one needs to talk to others, share ideas, listen, explain, and argue. It is in these deliberations that new knowledge is born. Learning is not passively memorizing so that you can repeat it later. When you learn actively, you engage with the material and—most importantly—share your ideas with others. You relate it to what you already know and benefit from the knowledge of your peers. You think about the material in as many different ways as you can. You ask yourself questions such as "Why does this make sense?" and "Under what circumstances does this not apply?" Skills developed during this process will be the most valuable in your future, no matter what profession you choose.

This book (your learning companion) includes many tools to support the active learning process: each problem-solving tool, worked example, observational experiment table, testing experiment table, review question, and end-of-chapter question and problem is designed to help you build your understanding of physics. To get the most out of these tools and the course, stay actively engaged in the process of developing ideas and applying them; form a learning group with your peers and try to work on the material together. When things get challenging, don't give up.

At this point you should turn to Chapter 1, Introducing Physics, and begin reading. That's where you'll learn the details of the approach that the book uses, what physics is, and how to be successful in the physics course you are taking.

To the instructor

Welcome to the second edition of *College Physics: Explore and Apply* and its supporting materials (Mastering™ Physics, the *Active Learning Guide* (ALG), and the *Instructor's Guide*), a coherent learning system that helps our students learn physics as an ongoing process rather than a static set of established concepts and mathematical relations. It is based on a framework known as ISLE (the *Investigative Science Learning Environment*). This framework originated in the work of Eugenia Etkina in the early 1990s. She designed a logical progression of student learning of physics that mirrors the processes in which physicists engage while constructing and applying knowledge. This progression was enriched in the early 2000s when Alan Van Heuvelen added his multiple representation approach. While logical flow represents a path for thinking, multiple representations are thinking tools. Since 2001, when ISLE curriculum development began, tens of thousands of students have been exposed to it as hundreds of instructors used the materials produced by the authors and their collaborators. Research on students learning physics through ISLE has shown that these students not only master the content of physics, but also become expert problem solvers, can design and evaluate their own experiments, communicate, and most importantly see physics as a process based on evidence as opposed to a set of rules that come from the book.

Experiments, experiments… The main feature of this system is that students practice developing physics concepts by following steps similar to those physicists use when developing and applying knowledge. The first introduction to a concept or a relation happens when students observe simple experiments (called **observational experiments**). Students learn to analyze these experiments, find patterns (either qualitative or quantitative) in the data, and develop multiple explanations for the patterns or quantitative relations. They then learn how to test the explanations and relations in new **testing experiments**. Sometimes the outcomes of the experiments might cause us to reject the explanations; often, they help us keep them. Students see how scientific ideas develop from evidence and are tested by evidence, and how evidence sometimes causes us to reject the proposed explanations. Finally, students learn how tested explanations and relations are applied for practical purposes and in problem solving. This is the process behind the subtitle of the book.

Explore and apply To help students explore and apply physics, we introduce them to tools: physics-specific representations, such as motion and force diagrams, momentum and energy bar charts, ray diagrams, and so forth. These representations serve as bridges between words and abstract mathematics. Research shows that students who use representations other than mathematics to solve problems are much more successful than those who just look for equations. We use a representations-based problem-solving strategy that helps students approach problem solving without fear and eventually develop not only problem-solving skills, but also confidence. The textbook and ALG introduce a whole library of novel problems and activities that help students develop competencies necessary for success in the 21st century: argumentation, evaluation, estimation, and communication. We use photo and video analysis, real-time data, and real-life situations to pose problems.

A flexible learning system There are multiple ways to use our learning system. Students can work collaboratively on ALG activities in class (lectures, labs, and problem-solving sessions) and then read the textbook and solve end-of-chapter problems at home, or they can first read the text and do the activities using Mastering Physics at home, then come to class and discuss their ideas. However they study, students will see physics as a living thing, a process in which they can participate as equal partners.

The key pedagogical principles of this book are described in detail in the first chapter of the *Instructor's Guide* that accompanies *College Physics*—please read that chapter. It elaborates on the implementation of the methodology that we use in this book and provides guidance on how to integrate the approach into your course.

While our philosophy informs *College Physics*, you need not fully subscribe to it to use this textbook. We've organized the book to fit the structure of most algebra-based physics courses: we begin with kinematics and Newton's laws, then move on to conserved quantities, statics, vibrations and waves, gases, fluids, thermodynamics, electricity and magnetism, optics, and finally modern physics. The structure of each chapter will work with any method of instruction. You can assign all of the innovative experimental tables and end-of-chapter problems, or only a few. The text provides thorough treatment of fundamental principles, supplementing this coverage with experimental evidence, new representations, an effective approach to problem solving, and interesting and motivating examples.

New to this edition

There were three main reasons behind the revisions in this second edition. (1) Users provided lots of feedback and we wanted to respond to it. (2) We (the authors) grew and changed, and learned more about how to help students learn, and our team changed—we have a new co-author, who is an expert in educational physics experiments and in the development of physics problems. (3) Finally, we wanted to respond to changes in the world (new physics discoveries, new technology, new skills required in the workplace) and to changes in education (the Next Generation Science Standards, reforms in the AP and MCAT exams). Our first edition was already well aligned with educational reforms, but the second edition strengthens this alignment even further.

We have therefore made the following global changes to the textbook, in addition to myriad smaller changes to individual chapters and elements:

- **An enhanced experiential approach**, with more experiment videos and photos (all created by the authors) and an updated and more focused and effective set of experiment tables, strengthens and improves the core foundation of the first edition. Approximately 150 photos and 40 videos have been added to the textbook, and even more to the ALG.
- **An expanded introductory chapter** (now Chapter 1) gives students a more detailed explanation of "How to use this book" to ensure they get the most out of the chapter features, use them actively, and learn how to think critically.
- **Integration of vector arithmetic in early chapters** allows students to develop vector-related skills in the context of learning physics, rather than its placement in an appendix in the first edition.
- **Earlier placement of waves and oscillations** allows instructors to teach these topics with mechanics if preferred. Coverage with optics is also still possible.
- **Significant new coverage of capacitors, AC circuits, and LEDs** (LEDs now permeate the whole book) expand the real-world and up-to-date applications of electricity.
- **Other new, revised, or expanded topics** include friction, 2-D collisions, energy, bar charts for rotational momentum and nuclear energy, ideal gas processes, thermodynamic engines, semiconductors, velocity selectors, and spacetime diagrams in special relativity.
- **Applications are integrated throughout each chapter,** rather than being grouped in the "Putting it all together" sections of the first edition, in order to optimize student engagement.
- **Problem-solving guidance is strengthened** by the careful revision of many Problem-Solving Strategy boxes and the review of each chapter's set of worked examples. The first edition Reasoning Skill boxes are renamed Physics Tool Boxes to better reflect their role; many have been significantly revised.
- **Streamlined text, layout, and figures** throughout the book enhance the focus on central themes and topics, eliminating extraneous detail. The second edition has over 150 fewer pages than the first edition, and the art program is updated with over 450 pieces of new or significantly revised art.
- **21st-century skills incorporated into many new worked examples and end-of-chapter problems** include data analysis, evaluation, and argumentation. Roughly 15% of all end-of-chapter questions and problems are new.
- **Careful analysis of Mastering Physics usage data** provides fine-tuned difficulty ratings and a more varied, useful, and robust set of end-of-chapter problems.
- **A fresh and modern design** provides a more transparent hierarchy of features and navigation structure, as well as an engaging chapter-opening page and streamlined chapter summary.

- **A significantly revised *Active Learning Guide*** is better integrated with the textbook, following the section sequence, and emphasizes collaboration, scientific reasoning, and argumentation.

All of the above sounds like a lot of work—and it was! But it was also lots of fun: we took photos of juice bottles sinking in the snow, we chased flying airplanes and running water striders, we drove cars with coffee cups on dashboards. Most exciting was our trip to a garbage plant to study and photograph the operation of an eddy current waste separator. Working on this new edition has enriched our lives, and we hope that using our textbook will enrich the lives of your students!

Instructor supplements

TIP All of the following materials are available for download on the Mastering Physics Instructor Resources page.

The **Instructor's Guide** (ISBN 0-134-89031-0), written by Eugenia Etkina, Gorazd Planinsic, David Brookes, and Alan Van Heuvelen, walks you through the innovative approaches they take to teaching physics. Each chapter of the *Instructor's Guide* contains a roadmap for assigning chapter content, *Active Learning Guide* assignments, homework, and videos of the experiments. In addition, the authors call out common pitfalls to mastering physics concepts and describe techniques that will help your students identify and overcome their misconceptions. Tips include how to manage the complex vocabulary of physics, when to use classroom response tools, and how to organize lab, lecture, and small-group learning time. Drawing from their extensive experience as teachers and researchers, the authors give you the support you need to make *College Physics* work for you.

The **Active Learning Guide** workbook (ISBN 0-134-60549-7) by Eugenia Etkina, David Brookes, Gorazd Planinsic, and Alan Van Heuvelen consists of carefully crafted cycles of in-class activities that provide an opportunity for students to conduct observational experiments, find patterns, develop explanations, and conduct the testing experiments for those explanations described in the textbook before they read it. These learning cycles are interspersed with "pivotal" activities that serve different purposes: (a) to introduce and familiarize students with new representational techniques, (b) to give students practice with representational techniques, (c) to directly address ideas that we *know* students struggle with (the goal is to encourage that struggle so that students reach a resolution either through their own discussion or by the instructor giving a "time for telling" lecture at the end of the activity), and (d) to provide scaffolding for students to work through an example or a passage in the textbook. The ALG also contains multiple experiments that can be used in labs. Whether the activities are assigned or not, students can always use this workbook to reinforce the concepts they have read about in the text, to practice applying the concepts to real-world scenarios, or to work with sketches, diagrams, and graphs that help them visualize the physics. The ALG is downloadable to share with your class; you may also talk to your sales representative about printing a custom version for your students.

The **Instructor Resource Materials** (ISBN 0-134-87386-6) on the Mastering Physics Instructor Resources page provide invaluable and easy-to-use resources for your class, organized by textbook chapter. The contents include a comprehensive library of all figures, photos, tables, and summaries from the textbook in JPEG and PowerPoint formats. A set of editable **Lecture Outlines**, **Open-Ended Questions**, and **Classroom Response System "Clicker" Questions** in PowerPoint will engage your students in class. Also included among the Instructor Resource Materials are the **Test Bank**, **Instructor Solutions Manual**, **Active Learning Guide**, **Active Learning Guide Solutions Manual**, and **Instructor Guide**.

Mastering™ Physics is the leading online homework, tutorial, and assessment platform designed to improve results by engaging students with powerful content. All Mastering resources, content, and tools are easy for both students and instructors to access in one convenient location. Instructors ensure that students arrive ready to learn by assigning educationally effective content before class and encourage critical thinking and retention with in-class resources such as Learning Catalytics™. Students can master concepts after class through traditional and adaptive homework assignments that provide hints and answer-specific feedback. The Mastering gradebook records scores for all automatically graded assignments in one place, while diagnostic tools give instructors access to rich data to assess student understanding and misconceptions.

New for the second edition of this book, Mastering Physics includes activities for students to do before coming to class, as an alternative to working through the *Active Learning Guide* activities prior to reading the textbook. These activities focus students' attention on observational experiments, helping them learn to identify patterns in the data, and on testing experiments, helping them learn how to make a prediction of an outcome of an experiment using an idea being tested, not personal intuition. Both skills are very important in science, but are very difficult to develop.

The significantly revised **Instructor's Solutions Manual**, provided as PDFs and editable Word files, gives complete solutions to all end-of chapter questions and problems using the textbook's problem-solving strategy.

The **Test Bank**, which has also been significantly revised, contains more than 2000 high-quality problems, with a range of multiple-choice, true/false, short-answer, and regular homework-type questions. Test files are provided in TestGen® (an easy-to-use, fully networkable program for creating and editing quizzes and exams), as well as PDF and Word format.

Student supplements

Physics experiment videos, accessed via the eText, with a smartphone through this QR code, at https://goo.gl/s2MerO, or online in the Mastering Physics Study Area, accompany most of the Observational and Testing Experiment Tables, as well as other discussions and problems in the textbook and in the ALG. Students can observe the exact experiment described in the text.

VIDEO

The **Pearson eText,** optimized for mobile, seamlessly integrates videos and other rich media with the text and gives students access to their textbook anytime, anywhere.

- The Pearson eText mobile app offers offline access and can be downloaded for most iOS and Android phones/tablets from the Apple App Store or Google Play
- Accessible (screen-reader ready)
- Configurable reading settings, including resizable type and night reading mode
- Instructor and student note-taking, highlighting, bookmarking, and search

The **Student Solutions Manual** (ISBN 0-134-88014-5) gives complete solutions to select odd-numbered end-of-chapter questions and problems using the textbook's problem-solving strategy.

In addition to content assigned by the instructor and this text's accompanying experiment videos, **Mastering™ Physics** also provides a wealth of self-study resources:

- **Dynamic Study Modules** assess student performance and activity in real time. They use data and analytics that personalize content to target each student's particular strengths and weaknesses. DSMs can be accessed from any computer, tablet, or smart phone.
- **PhET simulations** from the University of Colorado, Boulder are provided in the Mastering Physics Study Area to allow students to explore key concepts by interacting with these research-based simulations.
- **24/7 access to online tutors*** enables students to work one-on-one, in real time, with a tutor using an interactive whiteboard. Tutors will guide them through solving their problems using a problem-solving-based teaching style to help them learn underlying concepts. In this way, students will be better prepared to handle future assignments on their own.

Acknowledgments

We wish to thank the many people who helped us create this textbook and its supporting materials. First and foremost, we want to thank our team at Pearson Higher Education, especially Jeanne Zalesky, who believed that the book deserved a second edition; Alice Houston, who provided careful, constructive, creative, enriching, and always positive feedback on every aspect of the book and the ALG; Darien Estes, who fearlessly made pivotal decisions that made the new edition much better; Susan McNally, who tirelessly shepherded the book through all stages of production; and David Hoogewerff, who oversaw the Mastering Physics component of the program. Tiffany Mok and Leslie Lee oversaw the new edition of the *Active Learning Guide* and other supplements. Special thanks to Jim Smith and Cathy Murphy who helped shape the first edition of the book. We also want to thank Adam Black for believing in the future of the project.

Although Michael Gentile is not a co-author on the second edition, this work would be impossible without him; he contributed a huge amount to the first edition and provided continuous support for us when we were working on the second edition. No words will describe how grateful we are to have Paul Bunson on our team. Paul helped us with the end-of-chapter problem revisions and Mastering Physics and ALG activities, and provided many helpful suggestions, particularly on rotational mechanics, fluids, relativity, and quantum optics. In addition, he was the first to adopt the textbook even before the first edition was officially printed and since then has remained a vivid advocate and supporter of ISLE. We are indebted to Charlie Hibbard, who checked and rechecked every fact and calculation in the text. Brett Kraabel prepared detailed solutions for every end-of-chapter problem for the *Instructor's Solutions Manual*. We also want to thank all of the reviewers, in particular Jeremy Hohertz, who put their time and energy to providing thoughtful, constructive, and supportive feedback. We thank Matt Blackman for adding excellent problems to the Test Bank, Katerina Visnjic for her support of ISLE and the idea to expand energy bar charts to nuclear physics, and Mikhail Kagan for timely feedback. Our special thanks go to Lane Seeley for his thoughtful review of the energy chapter, which led to its deep revision. We thank Diane Jammula and Jay Pravin Kumar, who not only became avid supporters and users of ISLE but also helped create instructor resources for the second edition. We thank Ales Mohoric and Sergej Faletic for their suggestions on problems.

Our infinite thanks go to Xueli Zou, the first adopter of ISLE, and to Suzanne Brahmia, who came up with the Investigative Science Learning Environment acronym "ISLE" and was and is an effective user and tireless advocate of the ISLE learning strategy. Suzanne's ideas about relating physics and mathematics are reflected in many sections of the book. We are indebted to David Brookes, another tireless ISLE developer, whose research shaped the language we use. We thank all of Eugenia's students who are now physics teachers for providing feedback and ideas and using the book with their students.

We have been very lucky to belong to the physics teaching community. Ideas of many people in the field contributed to our understanding of how people learn physics and what approaches work best. These people include Arnold Arons, Fred Reif, Jill Larkin, Lillian McDermott, David Hestenes, Joe Redish, Stamatis Vokos, Jim Minstrell, David Maloney, Fred Goldberg, David Hammer, Andy Elby, Noah Finkelstein, David Meltzer, David Rosengrant, Anna Karelina, Sahana Murthy, Maria Ruibal-Villasenhor, Aaron Warren, Tom Okuma, Curt Hieggelke, and Paul D'Alessandris. We thank all of them and many others.

Personal notes from the authors

We wish to thank Valentin Etkin (Eugenia's father), an experimental physicist whose ideas gave rise to the ISLE philosophy many years ago, Inna Vishnyatskaya (Eugenia's mother), who never lost faith in the success of our book, and Dimitry and Alexander Gershenson (Eugenia's sons), who provided encouragement to Eugenia over the years. While teaching Alan how to play violin, Alan's uncle Harold Van Heuvelen provided an instructional system very different from that of traditional physics teaching. In Harold's system, many individual abilities (skills) were developed with instant feedback and combined over time to address the process of playing a complex piece of music. We tried to integrate this system into our ISLE physics learning system.

—Eugenia Etkina, Gorazd Planinsic, and Alan Van Heuvelen

*Please note that tutoring is available in selected Mastering products, and in those products you are eligible for one tutoring session of up to 30 minutes duration with your course. Additional hours can be purchased at reasonable rates.

Real-World Applications

Chapter 1

Estimating volume of drinking water for a flight 8

Chapter 2

Observing motion with a blinking LED 16
Jumping off a boulder (acceleration during landing) 35
Tailgating and driver's reaction time 40
BIO Froghopper jumps 47
BIO Squid propulsion 47
BIO Motion of a water strider 49
BIO Head injuries in sports 49
Automatic sliding doors 50

Chapter 3

Skydiving impact 67
Weighing yourself in an elevator 69
Hairdryer forces 73
Seat belts and air bags 75
BIO Bending legs when landing on a firm surface 79
Landing in snow 81
BIO Ventricle pumping blood 82
Plane crash tests 82

Chapter 4

BIO Physics of walking 91, 110
Pulling a sled 92, 96
Reading skid marks 98
Human cannonballs 106
Physics of driving 107
BIO Forces during whiplash 114
Airplane takeoff 117
Ski jumping 117

Chapter 5

BIO Fighter pilot blackout 126
Forces driving over a hump 128
Understanding a rotor ride 130
Speedway forces 132, 145
Are astronauts weightless? 138
BIO Ultracentrifuges 142
Tire pressure monitoring system 142
Relative motion and moving wheels 142
Determining adhesive forces 145
Halley's comet's motion 146

Chapter 6

Air-bag and seat-belt forces 155, 171, 172, 173
Stopping the fall of a stunt diver 161
BIO Bone fracture forces 162, 172
Rocket propulsion 164
BIO Forces in traumatic brain injury 170, 171
BIO Force exerted by heart on blood 171
BIO Leg injuries during car collisions 172
BIO Cuttlefish propulsion 173
BIO Potassium decay in body tissue
Meteorite impact with Earth 173
Analyzing a toy helicopter 174
BIO Heartbeat detector 174
Space Shuttle launch 175

Chapter 7

Physics of pole vaulting 185, 197
Analyzing roller coasters 189, 215
Reading skid marks 194
BIO Stretching the aorta 196
Black holes 206
BIO Work done by the heart 211
Wind energy 211
BIO Compressive forces in bone breaks 211
BIO Energy to climb Everest 211
BIO Froghopper jump 212
BIO Energy analysis of stairs, biking, exercising 213, 214
BIO Salmon swimming
BIO Metabolic rate 215
BIO Kangaroo hopping 216

Chapter 8

BIO Using your biceps 234
BIO Achilles tendon force 235
Lifting from a bent position 236, 248
Balancing on the subway 238
BIO Force that muscles exert on bones 244
BIO Movements that our bodies cannot do 244
Nutcracker design 246
BIO Biceps, hamstring, deltoid forces 248
BIO Neck muscle forces in football 248
Hand grip design 248
BIO Determining the mass of a part of a human body 249
BIO Muscles work in pairs 249
BIO Improper lifting and back pain 250

Chapter 9

Orbiting a black hole 255
Biceps force in throwing 265
Figure skater spinning 267
Jumping on a merry-go round 268
Pulsars, neutron stars, and white drawfs 269, 280, 282
Bicycling 270
Gyroscopes 271
Flywheels store energy 273, 281
Tides slow Earth's rotation 274
Centrifuges, mileage gauges, speedometers 278
Yo-yos 279, 282
BIO Punting a football 281
BIO Arm forces in darts and bowling 281
BIO Leg lift 281
Superball 282
Tidal energy 283

Chapter 10

Marching out of step on a bridge 284
Building vibration in high wind 288
Bouncy chair design 294
Measuring astronaut body mass in space 296
BIO Leg swinging during walking 299, 309
Vibration of CO_2 molecules and the greenhouse effect 303
Spiderweb vibrations 305
Resonance and bridge collapse 307
Detecting oil-rich geological structures with a sensitive pendulum 309
BIO Human ears and sound 311, 313

Chapter 11

BIO Human hearing and the ear 331, 347, 351
String instruments 337, 349
BIO Voice after inhaling helium 340
Wind instruments 340, 349
BIO Measuring blood flow speed 343, 350
Using light and sound to estimate distance 346
BIO Dolphin sonar 347
BIO Bats and echolocation 348, 350
BIO Reaction time 350

Chapter 12

BIO Breathing 371, 382, 383
Shrunken bottle on a plane 371, 375
BIO Scuba diving 374, 382
BIO Forced vital capacity 381
BIO Ear pop 382
Car tire pressure 382
BIO Vascular wall tension and aortic blowout 384
BIO Portable hyperbaric chamber 385

Chapter 13

BIO Glaucoma 390
Hydraulic lift 390, 410
BIO Popping your ears 395
Diving bells 397
Building a stable ship 404
Hot-air ballooning 405
BIO Altitude sickness 405
BIO Scuba diving 406
BIO Lakes freezes from top down 409, 414
BIO Blood pressure 410
BIO Intravenous feeding 410
BO Giraffe raises head 410
BIO The eardrum 410
Designing a dam 411
BIO Protein sinks in water 412
Submarine design 413
BIO Pressure in lungs 413
Measuring ocean depth using a soda bottle 413
Bubbles in champagne 413
BIO Fish bladders 413
BIO Free diving 414

Chapter 14

BIO Snoring 418
BIO Measuring blood pressure 420
Fire hoses 423, 436, 438
Blowing the roof off a house 425, 437
BIO Dislodging a plaque in an artery 426
How do airplanes fly? 427
BIO Blood flow through arteries, capillaries 430, 436, 437, 438
Terminal speed of a sky diver, skier 432, 439
BIO Flutter in blood vessel 437
BIO Effect of smoking on arteriole radius 437
BIO Protein terminal speed in water 438
BIO Thermal energy in the body due to viscous friction 439
BIO Essential hypertension 439
BIO Intravenous feeding 439
BIO The human circulatory system 440

Chapter 15

Calories in food 446
Expanding a hot air balloon 453
BIO Warming a hypothermic person 458
BIO Energy to vaporize sweat 462
Thermos bottles 465
Cooling a car engine 466
Passive solar heating 467, 473
The greenhouse effect and climate change 468
BIO Farmer's method to prevent fruit from freezing 471
BIO Dogs cooling themselves by panting 471
BIO Body temperature changes 472
BIO Cooling a hot child 473
House insulation 473
BIO Water lost during a marathon 473
BIO Tree leaf warming from sunlight 474
BIO Maintaining body temperature while running 474, 475
BIO Metabolism warming rooms 474
BIO Frostbite 474
Cloud formation 475

Chapter 16

Entropy and photosynthesis 487
Efficiency of car engines 490, 498
Refrigerators and air conditioners 492
Warming a house with a thermodynamic pump 494
BIO Human and warm-blooded animal metabolism 497, 498
BIO Efficiency of walking 498
Efficiency of nuclear power plants 498
Fuel used to counter air resistance 499

Chapter 17

Everyday electrostatic phenomena 501, 503, 507, 533
Grounding 511
The Van de Graaff generator 524
Photocopiers 526
BIO Ventricular defibrillation 530
BIO Electrical forces across cell walls 530
BIO Bee pollination 530
BIO Calcium ion synapse transfer 533
Electrostatic exploration of underground materials 533

Chapter 18

BIO Electric field and potential due to the heart's dipole 540, 547, 569
Electron speed in an X-ray machine 548
Grounding 553
Shielding during lightning 555
BIO Sodium ions in the nervous system 557–8
BIO Body cells as capacitors 561
BIO Electrocardiography (ECG) 563–4, 569
BIO Electric field across body cell membranes 568, 569
BIO Energy used to charge nerve cells 568
BIO Electric field of a fish 569, 570
BIO Axon capacitance 569
BIO Capacitance of red blood cells 569

BIO Defibrillators 569
BIO Can sharks detect an axon $\vec{E}$ field ? 570
BIO Electrophoresis 570
BIO Energy stored in an axons electric field 570
Electrostatic air cleaning devices 571

Chapter 19

Light-emitting diodes (LEDs) 583, 591
Household wiring 589, 612
Circuit breakers and fuses 599, 602
Semiconductors 606–7
BIO Electrolytes 607
BIO Preventing electric shock 610
BIO Electric currents in the body 611
BIO Current produced by electric eels 612
Subway rail resistance 613
BIO Respirator detector 613
BIO Resistance of human nerve cells 613
Conductive textiles 613
Types of household switches 614
BIO Hands and arms as a conductor 614
BIO Current across the membrane wall of an axon 614
BIO Signals in nerve cells stimulate muscles 614
BIO Effects of electric current on the human body 615

Chapter 20

Magnetic and geographic poles of Earth 617
Cathode ray tubes 628
The auroras 632
Mass spectrometers 637, 646
BIO Intensity modulated radiation therapy (IMRT) 638
BIO Magnetic force exerted by Earth on ions in the body 645
Minesweepers 646
Magnetic field sensor on your mobile phone 646
BIO Magnetic resonance imaging (MRI) 647
BIO Power lines—do their magnetic fields pose a risk? 647

Chapter 21

BIO Transcranial magnetic stimulation (TMS) 653, 664, 681
Microphones and seismometers 654
Magnetic braking 659, 683
Eddy current waste separators 659
Electric generators 666–7
Transformers 674–6, 682s
BIO Breathing monitors 679, 681
Burglar alarm design 680
Induction cooktops 680
Metal detectors 680
BIO Magnetic field and brain cells 681
BIO Hammerhead sharks 683
BIO Magnetic resonance imaging 683
Magstripe readers 683
BIO Magnetic induction tomography (MIT) 684
BIO Measuring the motion of flying insects 684

Chapter 22

Pinhole cameras 689, 708
The red-eye effect 692
BIO Measuring concentration of blood glucose 695, 697
BIO Fiber optics endoscope 701, 702
Mirages 703
Color of the sky 703
BIO Vitreous humor 708
Rain sensors 709
Rainbows 710

Chapter 23

Improving visibility with convex mirrors 716
Digital projectors 731
Magnifying glasses 732, 739
Photography and cameras 734–5
Light field cameras 736
BIO The human eye and corrective lenses 736–8, 747–749
Telescopes and microscopes 740–743, 748
BIO Seeing underwater 745
BIO Blind spots 745
Dentists' mirrors and lamps 746, 747
BIO Fish eyes, unusual and usual 746, 750
BIO Dissecting microscopes 748
BIO Laser surgery for the eye (LASIK) 749

Chapter 24

Chromatic aberration in optical instruments 759
Colors on CDs and DVDs 762
Spectrometers 762
Soap bubble colors 764, 767, 780
Lens coatings 767
BIO Bird and butterfly colors 764, 768
Resolving power of lenses 772–4, 780
Memory capacity of a CD 779
BIO Morpho butterfly wings 781
BIO Ability of a bat to detect small objects 781
BIO Diffraction-limited resolving power of the eye 782
BIO What is $20/20$ vision? 782
Thin-film window coatings for energy conservation 783

Chapter 25

Antennas 791
Radar 793–4, 810
The Global Positioning System (GPS) 794
Microwave cooking 795
Polarized sunglasses 804, 805
Liquid crystal displays (LCDs) 806
3-D movies 807
BIO Ultraviolet A and B 810
BIO X-rays used in medicine 810
BIO Laser to treat cancer 810
BIO Spider polarized light navigation 811
BIO Human vision power sensitivity 811
BIO Honeybee navigation 812
Incandescent lightbulbs 812

Chapter 26

Muons and cosmic rays 821, 824, 829
Police radar speed detector 835
Age of the universe 837, 845
Gravitational waves and black holes 839
GPS and relativity 840
BIO Mass equivalent of metabolic energy 845
Cherenkov radiation 846
Tennis serve speed measurement 846
Quasars 846

Chapter 27

Measuring stellar temperatures 849–850
X-rays 868–872
Solar cells 872, 878
Light-emitting diodes (LEDs) 874
BIO Safe photon energy in tanning beds 877
BIO Laser surgery 877
BIO Pulsed laser replaces dental drills 877
BIO Human vision sensitivity 877

BIO Energy absorption during X-rays 877
BIO Light detection by the human eye 878
BIO Firefly light 878
BIO Owl night vision 878
BIO Photosynthesis 878
BIO Radiation from our bodies 879

Chapter 28

Spectral analysis to identify chemical composition 892–5
Absorption spectrum of the Sun 896
BIO Why are plants green? 897
Lasers 897–8
BIO Laser surgery 899
Lidar mapping 899
BIO Hydrogen bonds in DNA molecules 913–914
BIO Welding the retina 917
BIO Electron microscopes 918
BIO Electron transport chains in photosynthesis and metabolism 919

Chapter 29

Fusion energy in the Sun 936
BIO Beta decay in our bodies 942
BIO Determining the source of carbon in plants 944
BIO Estimating blood volume 946
Carbon dating and archeology 947
BIO Relative biological effectiveness (RBE) of radiation 950
Sources of ionizing radiation 951
BIO Potassium decay in the body 954, 955
BIO O_2 emitted by plants 954
BIO Radiation therapy 954
BIO Dating a Wisconsin glacier tree sample 954
BIO Radiation dose 955
BIO Dose during X-ray exam 955
BIO Estimating the number of ants in a nest 955
BIO Ion production due to ionizing radiation 955
BIO Nuclear accidents and cancer risk 955, 956
Neutron activation analysis 956

Chapter 30

BIO Positron Emission Tomography (PET) 957, 962

Contents

1 Introducing Physics 1

1.1 What is physics? 2
1.2 Modeling 5
1.3 Physical quantities 6
1.4 Making rough estimates 8
1.5 Vector and scalar quantities 8
1.6 How to use this book to learn physics 9

2 Kinematics: Motion in One Dimension 13

2.1 What is motion? 14
2.2 A conceptual description of motion 15
2.3 Operations with vectors 18
2.4 Quantities for describing motion 21
2.5 Representing motion with data tables and graphs 22
2.6 Constant velocity linear motion 24
2.7 Motion at constant acceleration 30
2.8 Displacement of an object moving at constant acceleration 34
2.9 Skills for analyzing situations involving motion 37
Summary 42 • Questions and Problems 43

3 Newtonian Mechanics 51

3.1 Describing and representing interactions 52
3.2 Adding and measuring forces 55
3.3 Conceptual relationship between force and motion 56
3.4 Inertial reference frames and Newton's first law 60
3.5 Newton's second law 61
3.6 Gravitational force law 66
3.7 Skills for applying Newton's second law for one-dimensional processes 67
3.8 Forces come in pairs: Newton's third law 70
3.9 Seat belts and air bags 75
Summary 77 • Questions and Problems 78

4 Applying Newton's Laws 84

4.1 Vectors in two dimensions and force components 85
4.2 Newton's second law in component form 87
4.3 Friction 89
4.4 Skills for analyzing processes involving forces in two dimensions 96
4.5 Projectile motion 102
4.6 Starting and stopping a car 107
Summary 109 • Questions and Problems 110

5 Circular Motion 118

5.1 Qualitative dynamics of circular motion 119
5.2 Analyzing velocity change for circular motion 121
5.3 Radial acceleration and period 123
5.4 Skills for analyzing processes involving circular motion 127
5.5 The law of universal gravitation 133
Summary 139 • Questions and Problems 140

6 Impulse and Linear Momentum 147

6.1 Mass accounting 148
6.2 Linear momentum 149
6.3 Impulse and momentum 153
6.4 The generalized impulse-momentum principle 156
6.5 Skills for analyzing problems using impulse and momentum 159
6.6 Jet propulsion 163
6.7 Collisions in two dimensions 164
Summary 168 • Questions and Problems 169

7 Work and Energy 176

7.1 Work and energy 177
7.2 Energy is a conserved quantity 181
7.3 Quantifying gravitational potential and kinetic energies 186
7.4 Quantifying elastic potential energy 190
7.5 Friction and energy conversion 192
7.6 Skills for analyzing processes using the work-energy principle 194
7.7 Collisions 199

7.8 Power 202
7.9 Improving our model of gravitational potential energy 204
Summary 208 • Questions and Problems 209

8 Extended Bodies at Rest 217

8.1 Extended and rigid bodies 218
8.2 Torque: a new physical quantity 220
8.3 Conditions of equilibrium 227
8.4 Center of mass 230
8.5 Skills for analyzing situations using equilibrium conditions 233
8.6 Stability of equilibrium 237
Summary 242 • Questions and Problems 243

9 Rotational Motion 251

9.1 Rotational kinematics 252
9.2 Physical quantities affecting rotational acceleration 257
9.3 Newton's second law for rotational motion 260
9.4 Rotational momentum 266
9.5 Rotational kinetic energy 271
9.6 Tides and Earth's day 274
Summary 276 • Questions and Problems 277

10 Vibrational Motion 284

10.1 Observations of vibrational motion 285
10.2 Kinematics of vibrational motion 288
10.3 Dynamics of simple harmonic motion 292
10.4 Energy of vibrational systems 295
10.5 The simple pendulum 297
10.6 Skills for analyzing processes involving vibrational motion 299
10.7 Including friction in vibrational motion 304
10.8 Vibrational motion with an external driving force 305
Summary 308 • Questions and Problems 309

11 Mechanical Waves 315

11.1 Observations: pulses and wave motion 316
11.2 Mathematical descriptions of a wave 318
11.3 Dynamics of wave motion: speed and the medium 321
11.4 Energy, power, and intensity of waves 324
11.5 Reflection and impedance 326
11.6 Superposition principle and skills for analyzing wave processes 327
11.7 Sound 331
11.8 Standing waves on strings 335
11.9 Standing waves in air columns 338
11.10 The Doppler effect 340
Summary 345 • Questions and Problems 346

12 Gases 352

12.1 Structure of matter 353
12.2 Pressure, density, and the mass of particles 356
12.3 Quantitative analysis of an ideal gas 361
12.4 Temperature 364
12.5 Testing the ideal gas law 368
12.6 Speed distribution of particles 373
12.7 Skills for analyzing processes using the ideal gas law 374
12.8 Thermal energy, the Sun, and diffusion 376
Summary 379 • Questions and Problems 381

13 Static Fluids 386

13.1 Density 387
13.2 Pressure inside a fluid 389
13.3 Pressure variation with depth 391
13.4 Measuring atmospheric pressure 395
13.5 Buoyant force 398
13.6 Skills for analyzing static fluid problems 401
13.7 Ships, balloons, climbing, and diving 403
Summary 407 • Questions and Problems 408

14 Fluids in Motion 415

14.1 Fluids moving across surfaces—qualitative analysis 416
14.2 Flow rate and fluid speed 418
14.3 Types of fluid flow 420
14.4 Bernoulli's equation 420
14.5 Skills for analyzing processes using Bernoulli's equation 424
14.6 Viscous fluid flow 428
14.7 Drag force 431
Summary 435 • Questions and Problems 435

15 First Law of Thermodynamics 441

15.1 Internal energy and work in gas processes 442
15.2 Two ways to change the energy of a system 445
15.3 First law of thermodynamics 448
15.4 Applying the first law of thermodynamics to gas processes 451
15.5 Specific heat 455
15.6 Phase change 458
15.7 Heating mechanisms 463
Summary 470 • Questions and Problems 471

16 Second Law of Thermodynamics 476

16.1 Irreversible processes 477
16.2 Entropy: the microscopic approach 480
16.3 Entropy: the macroscopic approach 484
16.4 Quantitative analysis of thermodynamic engines and pumps 488

Summary 495 • Questions and Problems 496

17 Electric Charge, Force, and Energy 500

17.1 Electrostatic interactions 501
17.2 Explanations for electrostatic interactions 504
17.3 Conductors and insulators (dielectrics) 507
17.4 Coulomb's force law 512
17.5 Electric potential energy 516
17.6 Skills for analyzing processes involving electric charges 521
17.7 Charge separation and photocopying 524

Summary 528 • Questions and Problems 529

18 The Electric Field 535

18.1 A model of the mechanism for electrostatic interactions 536
18.2 Skills for analyzing processes involving $\vec{E}$ fields 542
18.3 The V field: electric potential 546
18.4 Relating the $\vec{E}$ field and the V field 550
18.5 Conductors in electric fields 552
18.6 Dielectric materials in an electric field 555
18.7 Capacitors 558
18.8 Electrocardiography 563

Summary 565 • Questions and Problems 566

19 DC Circuits 572

19.1 Electric current 573
19.2 Batteries and emf 576
19.3 Making and representing simple circuits 578
19.4 Ohm's law 581
19.5 Qualitative analysis of circuits 586
19.6 Joule's law 589
19.7 Kirchhoff's rules 592
19.8 Resistor and capacitor circuits 596
19.9 Skills for solving circuit problems 600
19.10 Properties of resistors 602

Summary 608 • Questions and Problems 609

20 Magnetism 616

20.1 Magnetic interactions 617
20.2 Magnetic field 618
20.3 Magnetic force on a current-carrying wire 621
20.4 Magnetic force exerted on a single moving charged particle 628
20.5 Magnetic fields produced by electric currents 632
20.6 Skills for analyzing magnetic processes 634
20.7 Magnetic properties of materials 639

Summary 642 • Questions and Problems 643

21 Electromagnetic Induction 649

21.1 Inducing an electric current 650
21.2 Magnetic flux 654
21.3 Direction of the induced current 656
21.4 Faraday's law of electromagnetic induction 659
21.5 Skills for analyzing processes involving electromagnetic induction 662
21.6 AC circuits 668
21.7 Transformers 674
21.8 Mechanisms explaining electromagnetic induction 677

Summary 678 • Questions and Problems 679

22 Reflection and Refraction 685

22.1 Light sources, light propagation, and shadows 686
22.2 Reflection of light 689
22.3 Refraction of light 692
22.4 Total internal reflection 696
22.5 Skills for analyzing reflective and refractive processes 698
22.6 Fiber optics, prisms, mirages, and the color of the sky 701
22.7 Explanation of light phenomena: two models of light 704

Summary 706 • Questions and Problems 707

23 Mirrors and Lenses 712

23.1 Plane mirrors 713
23.2 Qualitative analysis of curved mirrors 715
23.3 The mirror equation 721
23.4 Qualitative analysis of lenses 725
23.5 Thin lens equation and quantitative analysis of lenses 730
23.6 Skills for analyzing processes involving mirrors and lenses 734
23.7 Single-lens optical systems 735
23.8 Angular magnification and magnifying glasses 739
23.9 Telescopes and microscopes 740

Summary 744 • Questions and Problems 745

24 Wave Optics 751
24.1 Young's double-slit experiment 752
24.2 Refractive index, light speed, and wave coherence 757
24.3 Gratings: an application of interference 760
24.4 Thin-film interference 764
24.5 Diffraction of light 768
24.6 Resolving power 772
24.7 Skills for applying the wave model of light 774
Summary 777 • Questions and Problems 778

25 Electromagnetic Waves 784
25.1 Polarization of waves 785
25.2 Discovery of electromagnetic waves 788
25.3 Applications of electromagnetic waves 793
25.4 Frequency, wavelength, and the electromagnetic spectrum 795
25.5 Mathematical description of EM waves and EM wave energy 797
25.6 Polarization and light reflection 802
Summary 808 • Questions and Problems 809

26 Special Relativity 813
26.1 Ether or no ether? 814
26.2 Postulates of special relativity 817
26.3 Simultaneity 818
26.4 Time dilation 819
26.5 Length contraction 822
26.6 Spacetime diagrams 824
26.7 Velocity transformations 827
26.8 Relativistic momentum 828
26.9 Relativistic energy 830
26.10 Doppler effect for EM waves 834
26.11 General relativity 837
26.12 Global Positioning System (GPS) 840
Summary 842 • Questions and Problems 843

27 Quantum Optics 847
27.1 Black body radiation 848
27.2 Photoelectric effect 853
27.3 Quantum model explanation of the photoelectric effect 859
27.4 Photons 864
27.5 X-rays 867
27.6 Photocells, solar cells, and LEDs 872
Summary 875 • Questions and Problems 876

28 Atomic Physics 880
28.1 Early atomic models 881
28.2 Bohr's model of the atom: quantized orbits 886
28.3 Spectral analysis 892
28.4 Lasers 897
28.5 Quantum numbers and Pauli's exclusion principle 899
28.6 Particles are not just particles 903
28.7 Multi-electron atoms and the periodic table 907
28.8 The uncertainty principle 910
Summary 915 • Questions and Problems 916

29 Nuclear Physics 921
29.1 Radioactivity and an early nuclear model 922
29.2 A new particle and a new nuclear model 924
29.3 Nuclear force and binding energy 928
29.4 Nuclear reactions 932
29.5 Nuclear sources of energy 935
29.6 Mechanisms of radioactive decay 939
29.7 Half-life, decay rate, and exponential decay 943
29.8 Radioactive dating 947
29.9 Ionizing radiation and its measurement 949
Summary 952 • Questions and Problems 953

30 Particle Physics 957
30.1 Antiparticles 958
30.2 Fundamental interactions 962
30.3 Elementary particles and the Standard Model 966
30.4 Cosmology 972
30.5 Dark matter and dark energy 974
30.6 Is our pursuit of knowledge worthwhile? 978
Summary 979 • Questions and Problems 979
